MAX25606 Evaluation System

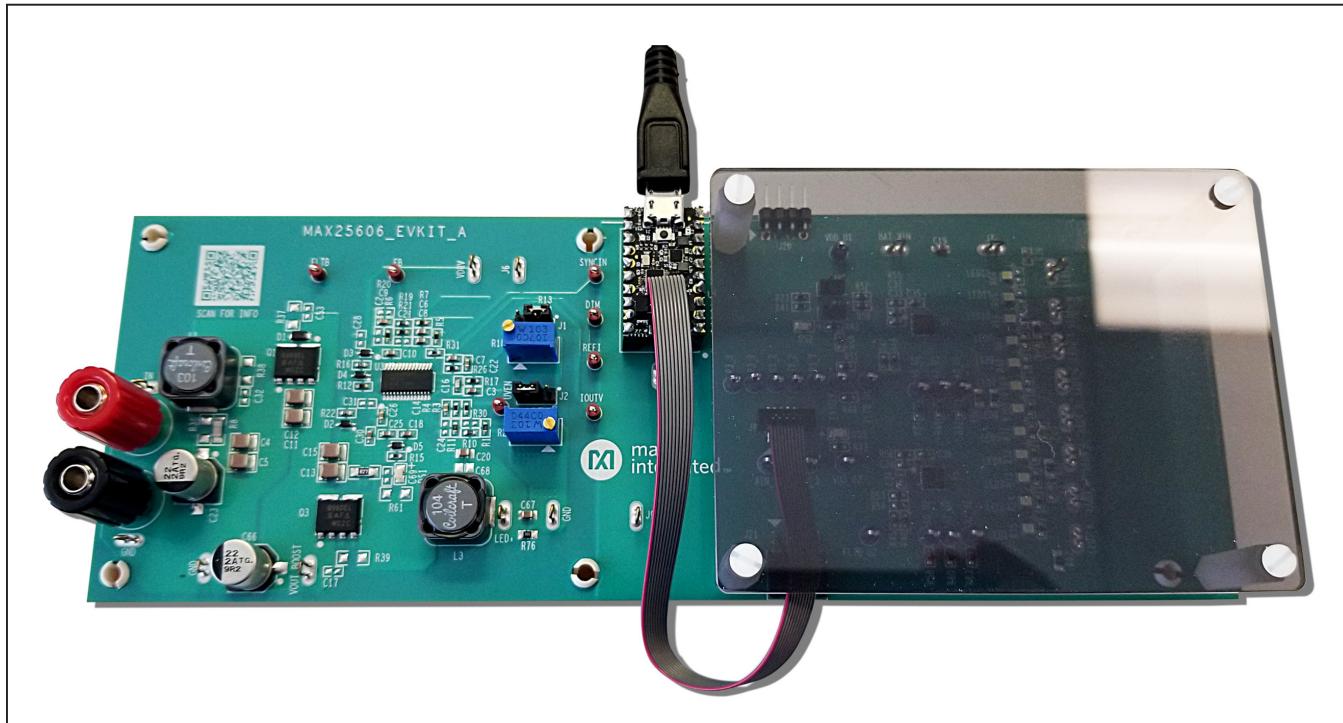

Evaluates: MAX25606

General Description

The MAX25606 evaluation System (EV system) provides a proven design to evaluate the MAX25606 six-channel LED matrix manager. The EV system includes two instances of the MAX25606 controlling twelve on-board LEDs connected in a series configuration. The MAX25601 Boost-Buck LED driver is also included to drive the LEDs.

[Ordering Information](#) appears at end of data sheet.

MAX25606 Evaluation System Board Photo

Features

- Two, Six-Channel Matrix Managers
- 12 On-Board White LEDs
- MAX25601 Boost-Buck LED Driver
- MAX32625PICO# Provides UART Communication to Control the Matrix Managers
- GUI for Easy Evaluation

Quick Start

Required Equipment

- MAX25606 evaluation system
- MAX32625PICO# (included)
- A Windows® 10 computer with GUI installed
- A 12V, 3A power supply

Procedure

The EV system is fully assembled and tested. Follow the steps below to verify board operation. **Caution: Do not turn on the power supply until all connections are made. Additional caution should be taken; the on-board LEDs are very bright when illuminated.**

- 1) Connect the positive terminal of the +12V power supply to the BAT_VIN pad
- 2) Connect the positive terminal of the +12V power supply to the IN test point
- 3) Connect the negative terminal of the +12V power supply to the GND test point
- 4) Connect the MAX32625PICO# to the MAX25606EV-SYS using the included ribbon cable

- 5) Connect the MAX32625PICO# to the computer with the included USB cable.
- 6) If the GUI is not installed, Install the GUI
- 7) Run the GUI

Detailed Description

The MAX25606 evaluation System provides a proven design to evaluate the MAX25606 six-channel LED matrix manager. The EV system includes two instances of the MAX25606 controlling twelve on-board LEDs connected in a series configuration. the MAX25601 Boost-buck LED driver is also included to drive the LEDs.

Analog Dimming Control (ICTRL)

When a shunt is installed across pins 2-3 of J2, the LED current is set by the R1/R2 resistor divider. The LED current is linearly proportional to the voltage on the ICTRL input. An ICTRL voltage of 200mV or less corresponds to $I_{LED} = 0A$. An ICTRL voltage of 1.3V or more corresponds to $I_{LED} = 0.8A$. between 200mV and 1.3V, the LED current is linearly adjusted between 0A and 0.8A respectively.

To set the LED current with an external reference, remove the shunt installed across J2, and instead apply a voltage across the ICTRL test point and the SGND pad.

Table 1. MAX25606 EV System Jumper Descriptions

JUMPER	SHUNT POSITION	DESCRIPTION
J1	1-2*	Connects V_{CC} to the DIM pin. 100% PWM dimming is enabled in this configuration.
	2-3	Connects DIM to a voltage-divider from V_{CC} to ground. When DIM is above 3V, the buck regulator is fully on at 100% dim duty cycle. When DIM is between 0.2V and 3V, the buck regulator operates at a duty cycle proportional to the DIM voltage, at a frequency of 200Hz. When DIM is below 0.2V, the buck regulator is disabled.
	Open	Disconnects DIM from the voltage divider. Allows DIM to be driven by an external voltage source or PWM signal to drive the DIM pin.
J2	1-2	Connects V_{CC} to the REFI pin. LED current is at the maximum value of 0.74A in this configuration.
	2-3*	Connects REFI to a voltage-divider from V_{CC} to ground. Adjusting R2 allows programming the LED current from 0 to 0.8A.
	open	Disconnects the REFI pin of the device from the external voltage-divider on the V_{CC} pin. Allows REFI to be driven by an external voltage to set the LED current level.
J3	1-2*	Pullup resistor from UART_TX to 1.8V V_{DD} .
	open	Pullup resistor to VDD not installed. In this case an external pullup should be added.
J4	1-2*	Pullup resistor from UART_RX to 1.8V V_{DD} .
	Open	Pullup resistor to VDD not installed. In this case an external pullup should be added.

*Default position.

Windows is a registered trademark and registered service mark of Microsoft Corporation.

Pulse-Dimming Input (PWMDIM)

Typically for matrix manager applications, the LED driver PWM dimming is not used. Therefore the default J1 position across pins 1-2 is sufficient. The matrix managers implement any desired PWM dimming on a per LED basis through the UART interface.

Graphical User Interface (GUI)

The EV system includes a GUI to facilitate evaluation of the MAX25606 Matrix manager device. Once the board is powered up and the PICO board is connected to the EV kit, click **Connect**. The Device 0 and Device 1 field

should populate with the appropriate device IDs of the MAX25606 devices.

Dimming

Individual channel PWM dimming can be controlled on the individual tab. The SW_GO_EN bit must be set to 1 before any switch programming can occur.

Register Map

The full register map is available on the Register tab. This tab also supports **Read** and **Write** commands for each register.

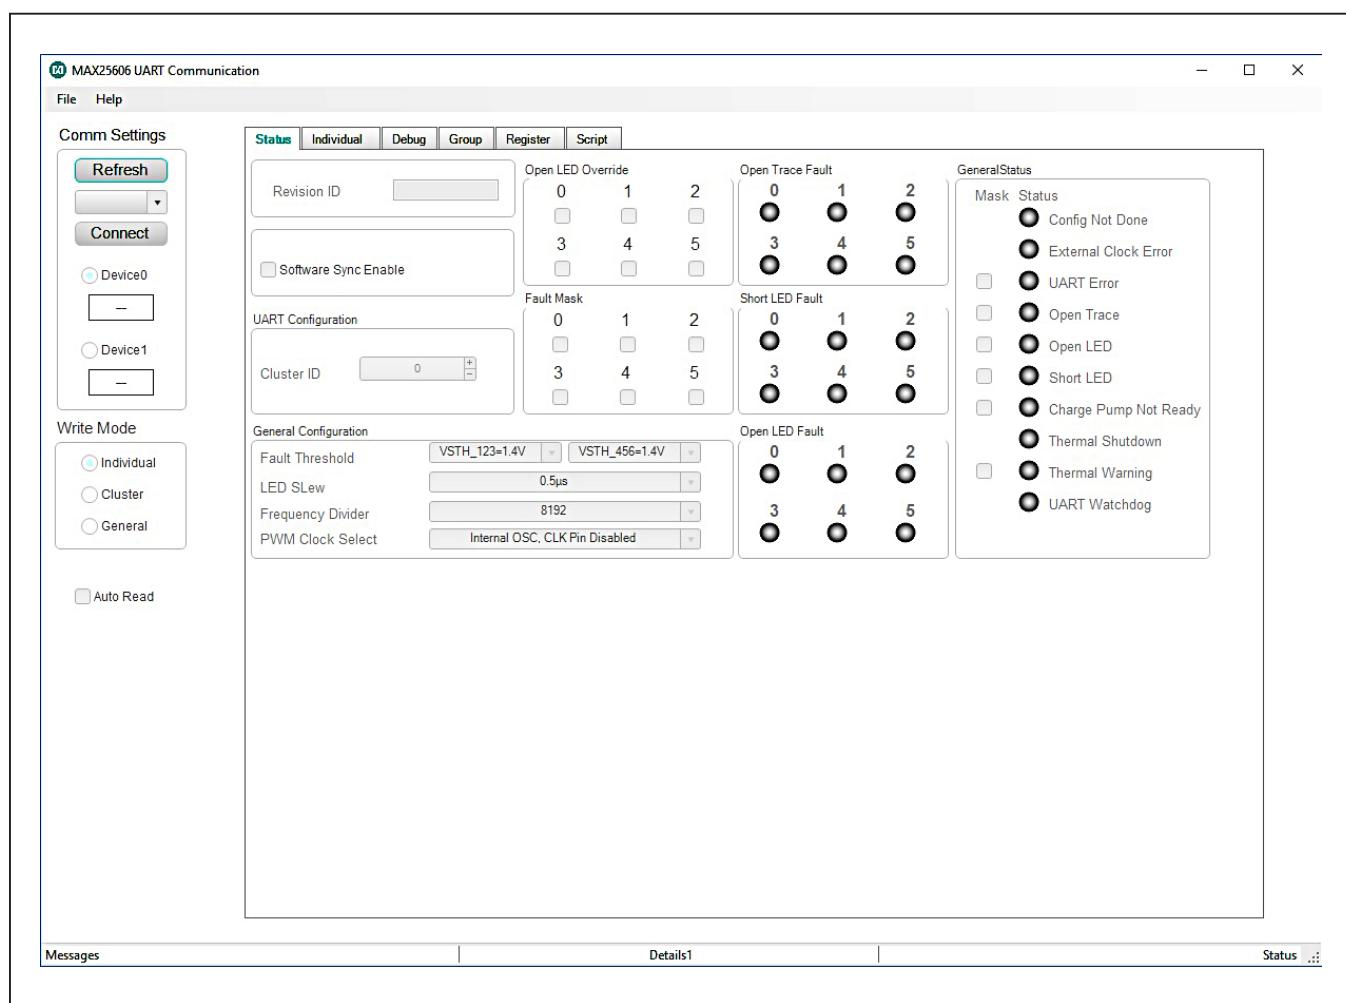

Figure 1. MAX25606 EV system Graphical User Interface

Scripting

The EV system GUI features the ability to run scripts that contain UART write commands and delay commands. Lighting animations can now be easily created and tested. Click the **Load Script** button to open a file navigator and select the desired **.json** file. The name of the script file will be populated in the **Script Name** field. Click **Run Script** and the commands in the script file begin executing in sequence until the script is complete.
