

## SY898535XL

Precision Differential 3.3V, Low Skew, 1:4  
Crystal Oscillator/LVCMOS/LVTTL -to-  
LVPECL Fanout Buffer

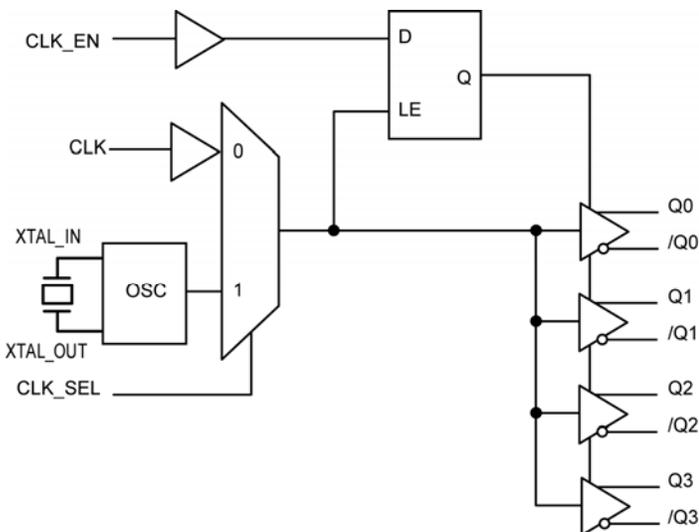

### General Description

The SY898535XL is a 3.3V, low skew, 1:4 Crystal Oscillator/LVCMOS/LVTTL-to-LVPECL fanout buffer with selectable single ended clock or crystal inputs. The clock input accepts LVCMOS or LVTTL input levels and translate them to 3.3V LVPECL levels. To eliminate runt pulses on the outputs during asynchronous assertion/de-assertion of the clock enable pin, the clock enable is synchronized with the input signal.

The SY898535XL operates from a 3.3V  $\pm 5\%$  supply and is guaranteed over the full industrial temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . The SY898535XL is part of Micrel's high-speed, Precision Edge<sup>®</sup> product line.

Datasheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

### Functional Block Diagram

### Features

- Provides four differential 3.3V LVPECL copies
- Selects between single-ended CLK or crystal inputs
- CLK accepts LVCMOS or LVTTL input levels
- Guaranteed AC performance over temperature and supply voltage:
  - 235MHz Maximum output frequency
  - <1.65ns Propagation delay (In-to-Q)
  - <30ps Output skew
  - <200ps Part-to-part skew
  - Additive phase jitter, RMS: 0.09ps (typical)
- 3.3V  $\pm 5\%$  supply voltage
- $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  industrial temperature operating range
- Available in a 20-pin TSSOP package

### Applications

- Gigabit Ethernet
- 10Gigabit Ethernet
- SONET/SDH
- PCI

### Markets

- LAN/WAN
- Enterprise servers
- ATE
- Test and measurement

## Pin Configuration

20-Pin TSSOP (K4-20-1)

## Pin Description

Pin Number	Pin Name	Pin Function
1	V <sub>EE</sub>	Ground.
2	CLK_EN	Single-Ended Input: This TTL/CMOS input disables and enables the Q0-Q3 outputs. It is internally connected to a 51kΩ pull-up resistor and will default to a logic HIGH state if left open. When disabled, Q goes LOW and /Q goes HIGH. CLK_EN being synchronous, outputs will be enabled/disabled following a rising and a falling edge of the input clock. V <sub>TH</sub> = is approximately 1.5V.
3	CLK_SEL	Single-Ended Input: This single-ended TTL/CMOS-compatible input selects the input to the multiplexer. If HIGH, selects XTAL input. If LOW, it selects CLK input. Note that this input is internally connected to a 51kΩ pull-down resistor and will default to logic LOW state if left open. V <sub>TH</sub> = is approximately 1.5V.
4	CLK	Single-Ended Input: This LVCMOS or LVTTTL signal is the input signal to the device. It is internally connected to a 51kΩ pull-down resistor and will default to a logic LOW state if left open. This input is selected when CLK_SEL is set to logic LOW.
6, 7	XTAL_IN, XTAL_OUT	Crystal oscillator interface. XTAL_IN is the input. XTAL_OUT is the output.
5, 8, 9	NC	Unused Pins
10, 13, 18	V <sub>CC</sub>	Positive Power Supply Pins: Bypass with 0.1μF  0.01μF low ESR capacitors as close to the V <sub>CC</sub> pins as possible.
20, 19 17, 16 15, 14 12, 11	Q0, /Q0 Q1, /Q1 Q2, /Q2 Q3, /Q3	LVPECL Differential Output Pairs: Differential buffered output copies the selected input signal. The output swing is typically 800mV. Unused output pairs may be left floating with no impact on jitter. See "Truth Table" below.

**Notes:**

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3.  $\theta_{JA}$  value is determined for a 4-layer board in still air unless otherwise stated.
4. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
5. 50 $\Omega$  to  $V_{CC}-2V$  terminated outputs.

### Notes:

- High-frequency AC-parameters are guaranteed by design and characterization.
- Measured from  $V_{CC}/2$  of the input to the differential output crossing point.
- Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the output differential cross points.
- Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.
