# **TDA8945S**

15 W mono Bridge Tied Load (BTL) audio amplifier

Rev. 02 — 7 April 2000 Product 9

**Product specification** 

# **General description**

The TDA8945S is a single-channel audio power amplifier with an output power of 15 W at an 8  $\Omega$  load and an 18 V supply. The circuit contains a Bridge Tied Load (BTL) amplifier with an all-NPN output stage and standby/mute logic. The TDA8945S comes in a 9-lead single in-line (SIL) power package. The TDA8945S is printed-circuit board (PCB) compatible with all other types in the TDA894x family. One PCB footprint accommodates both the mono and the stereo products.

#### **Features** 2.

- Few external components
- Fixed gain
- Standby and mute mode
- No on/off switching plops
- Low standby current
- High supply voltage ripple rejection
- Outputs short-circuit protected to ground, supply and across the load
- Thermally protected
- Printed-circuit board compatible.

# **Applications**

- Mains fed applications (e.g. TV sound)
- PC audio
- Portable audio.

# 8. Functional description

The TDA8945S is a mono BTL audio power amplifier capable of delivering 15 W output power to an 8  $\Omega$  load at THD = 10%, using an 18 V power supply and an external heatsink. The voltage gain is fixed at 32 dB.

With the three-level MODE input the device can be switched from 'standby' to 'mute' and to 'operating' mode.

The TDA8945S outputs are protected by an internal thermal shutdown protection mechanism and a short-circuit protection.

15 W mono BTL audio amplifier

#### 8.1 Input configuration

The TDA8945S inputs can be driven symmetrical (floating) as well as asymmetrical. In the asymmetrical mode one input pin is connected via a capacitor to the signal ground which should be as close as possible to the SVR (electrolytic) capacitor ground. Note that the DC level of the input pins is half of the supply voltage  $V_{CC}$ , so coupling capacitors for both pins are necessary.

The input cut-off frequency is:

$$f_{i(cut-off)} = \frac{1}{2\pi(R_i \times C_i)} \tag{1}$$

For  $R_i = 45 \text{ k}\Omega$  and  $C_i = 220 \text{ nF}$ :

$$f_{i(cut-off)} = \frac{1}{2\pi (45 \times 10^3 \times 220 \times 10^{-9})} = 16 \,\text{Hz}$$
 (2)

As shown in Equation 1 and 2, large capacitor values for the inputs are not necessary; so the switch-on delay during charging of the input capacitors, can be minimized. This results in a good low frequency response and good switch-on behaviour.

**Remark:** To prevent HF oscillations do not leave the inputs open, connect a capacitor of at least 1.5 nF across the input pins close to the device.

#### 8.2 Power amplifier

The power amplifier is a Bridge Tied Load (BTL) amplifier with an all-NPN output stage, capable of delivering a peak output current of 2 A.

The BTL principle offers the following advantages:

- Lower peak value of the supply current
- The ripple frequency on the supply voltage is twice the signal frequency
- No expensive DC-blocking capacitor
- Good low frequency performance.

#### 8.2.1 Output power measurement

The output power as a function of the supply voltage is measured on the output pins at THD = 10%; see Figure 8. The maximum output power is limited by the maximum supply voltage of 18 V and the maximum available output current: 2 A repetitive peak current.

15 W mono BTL audio amplifier

#### 8.2.2 Headroom

Typical CD music requires at least 12 dB (factor 15.85) dynamic headroom – compared to the average power output – for transferring the loudest parts without distortion. At  $V_{CC}$  = 18 V,  $R_L$  = 8  $\Omega$  and  $P_o$  = 10 W at THD = 0.1% (see Figure 6), the Average Listening Level (ALL) – music power – without any distortion yields:

$$P_{o(ALL)} = 10 \text{ W}/15.85 = 631 \text{ mW}.$$

The power dissipation can be derived from Figure 11 on page 10 for 0 dB respectively 12 dB headroom.

Table 4: Power rating as function of headroom

| Headroom | Power output (THD = 0.1%)    | Power dissipation (P) |
|----------|------------------------------|-----------------------|
| 0 dB     | P <sub>o</sub> = 10 W        | 8.5 W                 |
| 12 dB    | P <sub>o(ALL)</sub> = 631 mW | 4 W                   |

For the average listening level a power dissipation of 4 W can be used for a heatsink calculation.

#### 8.3 Mode selection

The TDA8945S has three functional modes, which can be selected by applying the proper DC voltage to pin MODE. See Figure 4 and 5 for the respective DC levels, which depend on the supply voltage level. The MODE pin can be driven by a 3-state logic output stage: e.g. a microcontroller with additional components for DC-level shifting.

**Standby** — In this mode the current consumption is very low and the outputs are floating. The device is in standby mode when  $(V_{CC} - 0.5 \text{ V}) < V_{MODE} < V_{CC}$ , or when the MODE pin is left floating (high impedance). The power consumption of the TDA8945S will be reduced to <0.18 mW.

**Mute** — In this mode the amplifier is DC-biased but not operational (no audio output); the DC level of the input and output pins remain on half the supply voltage. This allows the input coupling and Supply Voltage Ripple Rejection (SVRR) capacitors to be charged to avoid pop-noise. The device is in mute mode when  $3 \text{ V} < \text{V}_{\text{MODE}} < (\text{V}_{\text{CC}} - 1.5 \text{ V})$ .

**Operating** — In this mode the amplifier is operating normally. The operating mode is activated at  $V_{\text{MODE}} < 0.5 \text{ V}$ .

#### 8.3.1 Switch-on and switch-off

To avoid audible plops during supply voltage switch-on or switch-off, the device is set to standby mode before the supply voltage is applied (switch-on) or removed (switch-off).

The switch-on and switch-off time can be influenced by an RC-circuit on the MODE pin. Rapid on/off switching of the device or the MODE pin may cause 'click- and pop-noise'. This can be prevented by proper timing of the RC-circuit on the MODE pin.

15 W mono BTL audio amplifier

#### 8.4 Supply Voltage Ripple Rejection (SVRR)

The SVRR is measured with an electrolytic capacitor of 10  $\mu$ F on pin SVR at a bandwidth of 10 Hz to 80 kHz. Figure 12 on page 11 illustrates the SVRR as function of the frequency. A larger capacitor value on the SVR pin improves the ripple rejection behaviour at the lower frequencies.

#### 8.5 Built-in protection circuits

The TDA8945S contains two types of protection circuits, i.e. short-circuit and thermal shutdown.

#### 8.5.1 Short-circuit protection

**Short-circuit to ground or supply line** — This is detected by a so-called 'missing current' detection circuit which measures the current in the positive supply line and the current in the ground line. A difference between both currents larger than 0.7 A, switches the power stage to standby mode (high impedance).

**Short-circuit across the load** — This is detected by an absolute-current measurement. An absolute-current larger than 3 A, switches the power stage to standby mode (high impedance).

#### 8.5.2 Thermal shutdown protection

The junction temperature is measured by a temperature sensor; at a junction temperature of approximately 150 °C this detection circuit switches the power stage to standby mode (high impedance).

# 9. Limiting values

Table 5: Limiting values
In accordance with the Absolute Maximum Rating System (IEC 60134).

| Symbol              | Parameter  | Conditions    | Min  | Max            | Unit |

15 W mono BTL audio amplifier

# 14. Application information

#### 14.1 Printed-circuit board (PCB)

#### 14.1.1 Layout and grounding

For a high system performance level certain grounding techniques are essential. The input reference grounds have to be tied with their respective source grounds and must have separate tracks from the power ground tracks; this will prevent the large (output) signal currents from interfering with the small AC input signals.

The small-signal ground tracks should be physically located as far as possible from the power ground tracks. Supply and output tracks should be as wide as possible for delivering maximum output power.

15 W mono BTL audio amplifier

#### Fig 14. Printed-circuit board layout (single-sided); components view.

### 14.1.2 Power supply decoupling

Proper supply bypassing is critical for low-noise performance and high supply voltage ripple rejection. The respective capacitor locations should be as close as possible to the device and grounded to the power ground. Proper power supply decoupling also prevents oscillations.

For suppressing higher frequency transients (spikes) on the supply line a capacitor with low ESR – typical 100 nF – has to be placed as close as possible to the device. For suppressing lower frequency noise and ripple signals, a large electrolytic capacitor – e.g. 1000 μF or greater – must be placed close to the device.

The bypass capacitor on the SVR pin reduces the noise and ripple on the midrail voltage. For good THD and noise performance a low ESR capacitor is recommended.

15 W mono BTL audio amplifier

#### 14.2 Thermal behaviour and heatsink calculation

The measured maximum thermal resistance of the IC package, R<sub>th(j-mb)</sub> is 9 K/W. A calculation for the heatsink can be made, with the following parameters:

$$T_{amb(max)} = 50 \, ^{\circ}\text{C}$$
 
$$V_{CC} = 18 \, \text{V and R}_{L} = 8 \, \Omega$$
 
$$T_{i(max)} = 150 \, ^{\circ}\text{C}.$$

 $R_{th(tot)}$  is the total thermal resistance between the junction and the ambient including the heatsink. In the heatsink calculations the value of  $R_{th(mb-h)}$  is ignored.

At  $V_{CC}$  = 18 V and  $R_L$  = 8  $\Omega$  the measured worst-case sine-wave dissipation is 8.5 W; see Figure 11. For  $T_{j(max)}$  = 150 °C the temperature raise – caused by the power dissipation – is: 150 – 50 = 100 °C.

$$\begin{split} P \times R_{th(tot)} &= 100 \text{ °C} \\ R_{th(tot)} &= 100/8.5 = 11.8 \text{ K/W} \\ R_{th(h-a)} &= R_{th(tot)} - R_{th(j-mb)} = 11.8 - 9 = 2.8 \text{ K/W}. \end{split}$$

The calculation above is for an application at worst-case sine-wave output signals. In practice music signals will be applied, which decreases the maximum power dissipation to approximately half of the sine-wave power dissipation (see Section 8.2.2). This allows for the use of a smaller heatsink:

$$\begin{split} P \times R_{th(tot)} &= 100~^{\circ}C \\ R_{th(tot)} &= 100/4 = 25~\text{K/W} \\ R_{th(h\text{-}a)} &= R_{th(tot)} - R_{th(j\text{-}mb)} ~= 25 - 9 = 16~\text{K/W}. \end{split}$$

To increase the lifetime of the IC,  $T_{j(max)}$  should be reduced to 125 °C. This requires a heatsink of approximately 10 K/W for music signals.

#### 15. Test information

### 15.1 Quality information

The General Quality Specification for Integrated Circuits, SNW-FQ-611D is applicable.

#### 15.2 Test conditions

 $T_{amb}$  = 25 °C;  $V_{CC}$  = 18 V; f = 1 kHz;  $R_L$  = 8  $\Omega$ ; audio pass band 22 Hz to 22 kHz; unless otherwise specified.

**Remark:** In the graphs as function of frequency no bandpass filter was applied; see Figure 7 and 12.

# 17. Soldering

#### 17.1 Introduction to soldering through-hole mount packages

This text gives a brief insight to wave, dip and manual soldering. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

Wave soldering is the preferred method for mounting of through-hole mount IC packages on a printed-circuit board.

#### 17.2 Soldering by dipping or by solder wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joints for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg(max)}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

#### 17.3 Manual soldering

Apply the soldering iron (24 V or less) to the lead(s) of the package, either below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300  $^{\circ}$ C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400  $^{\circ}$ C, contact may be up to 5 seconds.

### 17.4 Package related soldering information

Table 10: Suitability of through-hole mount IC packages for dipping and wave soldering methods

| Package                   | Soldering method |                         |  |  |
|---------------------------|------------------|-------------------------|--|--|
|                           | Dipping          | Wave                    |  |  |
| DBS, DIP, HDIP, SDIP, SIL | suitable         | suitable <sup>[1]</sup> |  |  |

<sup>[1]</sup> For SDIP packages, the longitudinal axis must be parallel to the transport direction of the printed-circuit board.

# 18. Revision history

| lev | Date     | CPCN | Description  |
|-----|----------|------|--|
| 02  | 20000407 | -    | Product specification; second version; supersedes initial version TDA8945S-01 of 14 April 1999 (9397 750 04878). Modifications:  |
|     |          |      | <ul> <li>Table 1 on page 1: SVRR: Typ value 65 dB → added</li> </ul>   |
|     |          |      | Ordering options removed   |
|     |          |      | Section 8 "Functional description":  |
|     |          |      | <ul> <li>Section 8.1 "Input configuration" on page 4 → added.</li> </ul>   |
|     |          |      | <ul> <li>Section 8.2 "Power amplifier" on page 4:, capable of delivering a peak output<br/>current of 1.5 A → changed to 2 A.</li> </ul>   |
|     |          |      | <ul> <li>Section 8.2.1 "Output power measurement" on page 4 → added</li> </ul>   |
|     |          |      | <ul> <li>Section 8.2.2 "Headroom" on page 5 → added</li> </ul>   |
|     |          |      | • Section 8.3 "Mode selection":  |
|     |          |      | – Standby mode: $V_{MODE} > (V_{CC} - 0.5 \text{ V}) \rightarrow \text{changed to } (V_{CC} - 0.5 \text{ V}) < V_{MODE} < V_{CC}; \text{ The power consumption of the TDA8945S will be reduced to } <0.18 \text{ mW} \rightarrow \text{added}.$  |
|     |          |      | <ul> <li>Mute mode: the DC level of the input and output pins remain on half the supply<br/>voltage → added;</li> </ul>  |
|     |          |      | – 2.5 V < $V_{MODE}$ < ( $V_{CC}$ – 1.5 V) $\rightarrow$ changed to 3 V < $V_{MODE}$ < ( $V_{CC}$ – 1.5 V)   |
|     |          |      | <ul> <li>Section 8.3.1 "Switch-on and switch-off" on page 5 → added.</li> </ul>  |
|     |          |      | • Section 8.4 "Supply Voltage Ripple Rejection (SVRR)" on page $6 \rightarrow$ added   |
|     |          |      | <ul> <li>Section 8.5 "Built-in protection circuits" on page 6 → added</li> </ul>   |
|     |          |      | • Table 5 on page 6:   |
|     |          |      | <ul> <li>P<sub>tot</sub> value added 14 W</li> </ul>   |
|     |          |      | <ul> <li>V<sub>CC(sc)</sub> value added 18 V</li> </ul>  |
|     |          |      | • Table 6 on page 6: $R_{th(j-a)}$ removed; $R_{th(j-c)}$ value 10 K/W changed to $\rightarrow R_{th(j-mb)}$ value 9 K/W changed to $R_{th(j-mb)}$ |
|     |          |      | • Table 7 on page 7: $V_{MODE}$ – mute mode – value Min 2.5 $\rightarrow$ changed to 3 $V$   |
|     |          |      | • Table 8 on page 8:   |
|     |          |      | – SVRR; Typ values 65 and 60 dB $\rightarrow$ added  |
|     |          |      | – $R_{source}$ changed to $\rightarrow$ $R_S$ in table and associated table notes  |
|     |          |      | – Table note [2]: 100 mV (RMS) changed to $\rightarrow$ 700 mV (RMS)   |
|     |          |      | • Figure 3 to 12: figures added  |
|     |          |      | <ul> <li>Section 13 "Internal circuitry" on page 12: → added</li> </ul>  |
|     |          |      | • Figure 14: figure modified   |
|     |          |      | <ul> <li>Section 14.1 "Printed-circuit board (PCB)" on page 13: → added</li> </ul>   |
|     |          |      | • Figure 14: figure added  |
|     |          |      | <ul> <li>Section 14.2 "Thermal behaviour and heatsink calculation" on page 15: → added</li> </ul>  |
|     |          |      | <ul> <li>Section 15 "Test information" on page 15: Section 15.1 → updated</li> </ul>   |
|     |          |      | <ul> <li>Section 15.2 "Test conditions" on page 15: → added.</li> </ul>  |

#### 19. Data sheet status

| Datasheet status          | Product status | Definition [1]   |
|---------------------------|----------------|--|
| Objective specification   | Development    | This data sheet contains the design target or goal specifications for product development. Specification may change in any manner without notice.  |
| Preliminary specification | Qualification  | This data sheet contains preliminary data, and supplementary data will be published at a later date. Philips Semiconductors reserves the right to make changes at any time without notice in order to improve design and supply the best possible product. |
| Product specification     | Production     | This data sheet contains final specifications. Philips Semiconductors reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.   |

[1] Please consult the most recently issued data sheet before initiating or completing a design.

#### 20. Definitions

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

### 21. Disclaimers

**Life support** — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
