\*JEDEC Registered Data

# 1N957B thru 1N992B DO-7

**NOTE 1** The JEDEC type numbers shown (B suffix) have a  $\pm 5\%$  tolerance on nominal zener voltage. The suffix A is used to identify  $\pm 10\%$  tolerance; suffix C is used to identify  $\pm 2\%$ ; and suffix D is used to identify  $\pm 1\%$  tolerance; no suffix indicates  $\pm 20\%$  tolerance.

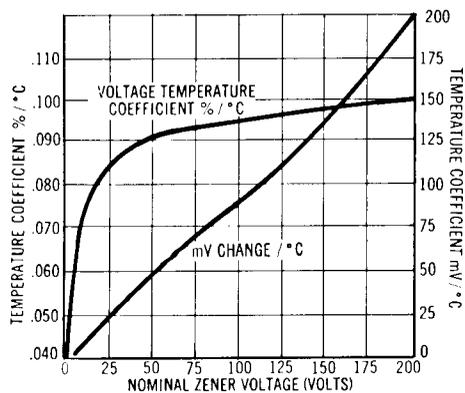

**NOTE 2** Zener voltage ( $V_Z$ ) is measured after the test current has been applied for  $20 \pm 5$  seconds. The device shall be suspended by its leads with the inside edge of the mounting clips between .375" and .500" from the body. Mounting clips shall be maintained at a temperature of  $25 +8/-2^\circ\text{C}$ .

**NOTE 3** The zener impedance is derived from the 60 cycle A.C. voltage, which results when an A.C. current

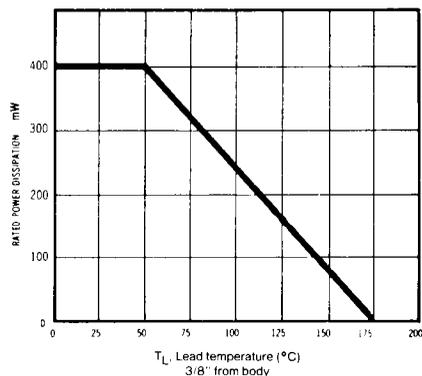

having an R.M.S. value equal to 10% of the D.C. zener current ( $I_{ZT}$  or  $I_{ZK}$ ) is superimposed on  $I_{ZT}$  or  $I_{ZK}$ . Zener impedance is measured at 2 points to insure a sharp knee on the breakdown curve and to eliminate unstable units.

**NOTE 4** The values of  $I_{ZM}$  are calculated for a  $\pm 5\%$  tolerance on nominal zener voltage. Allowance has been made for the rise in zener voltage above  $V_{ZT}$  which results from zener impedance and the increase in junction temperature as power dissipation approaches 400 mW. In the case of individual diodes  $I_{ZM}$  is that value of current which results in a dissipation of 400 mW at  $50^\circ\text{C}$  lead temperature at  $3/8"$  from body.

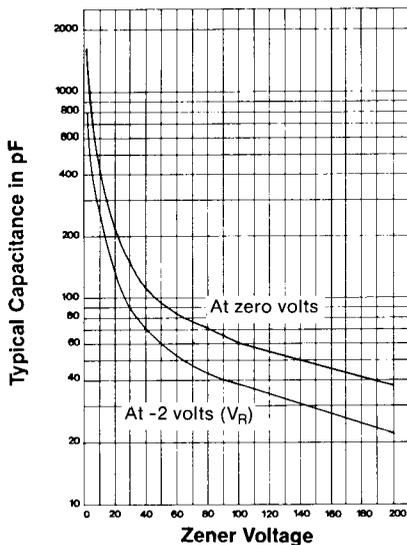

**NOTE 5** Surge is 1/2 square wave or equivalent sine wave pulse of 1/120 sec. duration.
