# ACFL-6211T, ACFL-6212T

Automotive High-Speed, Low-Power Digital Optocoupler with R<sup>2</sup>Coupler<sup>®</sup> Isolation in a Stretched 12-Pin Surface Mount Plastic Package

# **Data Sheet**

## Description

The ACFL-6211T and ACFL-6212T are automotive grade dual channel, bi-directional, high speed digital CMOS optocouplers. The stretched SO-12 stretched package outline is designed to be compatible with standard surface mount processes and occupies the same land area as their single channel equivalent, ACPL-K71T and ACPL-K72T, in stretched SO8 package.

This digital optocoupler uses an insulating layer between the light emitting diode and an integrated photo detector to provide electrical insulation between input and output. Each channel of the digital optocoupler has a CMOS detector IC with an integrated photodiode, a high speed trans-impedance amplifier, and a voltage comparator with an output driver. Each channel is also isolated from the other.

Broadcom R<sup>2</sup>Coupler technology provides reinforced insulation and reliability that delivers safe signal isolation critical in automotive and high temperature industrial applications.

#### **Functional Diagram**

Note: The connection of a 1  $\mu$ F bypass capacitor between pins 1 and 3 and pins 8 and 10 is recommended.

**CAUTION:** It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD. The components featured in this datasheet are not to be used in military or aerospace applications or environments.

#### **Features**

- Qualified to AEC Q100 Grade 1 Test Guidelines
- Automotive Wide Temperature Range: –40°C to +125°C

**.** BROADCOM®

- 5V CMOS compatibility
- 40 kV/µs Common-Mode Rejection at VCM=1000V (typ)
- Low Propagation Delay :
- ACFL-6211T: 25 ns at I<sub>F</sub> = 10 mA (typ)
- ACFL-6212T: 60 ns at I<sub>F</sub> = 4 mA (typ)
- Compact, Auto-Insertable Stretched SO12 Packages
- Worldwide Safety Approval:
  - UL 1577 recognized, 5 kV<sub>RMS</sub>/1 min.
  - CSA Approved
  - IEC/EN/DIN EN 60747-5-5

#### Features

- Automotive IPM Driver for DC-DC converters and motor inverters
- CANBus and SPI Communications Interface
- High Temperature Digital/Analog Signal Isolation
- Power Transistor Isolation

Notes:

1. t<sub>PHL</sub> propagation delay is measured from the 50% (V<sub>IN</sub> or I<sub>F</sub>) on the rising edge of the input pulse to the 0.8V of V<sub>DD</sub> of the falling edge of the V<sub>O</sub> signal. t<sub>PLH</sub> propagation delay is measured from the 50% (V<sub>IN</sub> or I<sub>F</sub>) on the falling edge of the input pulse to the 80% level of the rising edge of the V<sub>O</sub> signal.

2. PWD is defined as |t<sub>PHL</sub> - t<sub>PLH</sub>|.

3. t<sub>PSK</sub> is equal to the magnitude of the worst case difference in t<sub>PHL</sub> and/or t<sub>PLH</sub> that will be seen between units at any given temperature within the recommended operating conditions.

4. CM<sub>H</sub> is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state.

5. CM<sub>L</sub> is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state.

6. Device considered a two terminal device: pins 1 to 6 shorted together, and pins 7 to 12 shorted together.

7. In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage >  $6000V_{RMS}$  for 1 second.

#### **Thermal Resistance Measurement**

The diagram of ACFL-6211T/6212T for measurement is shown in Figure 15. This is a multi-chip package with four heat sources, the effect of heating of one die due to the adjacent dice are considered by applying the theory of linear superposition. Here, one die is heated first and the temperatures of all the dice are recorded after thermal equilibrium is reached. Then, the second die is heated and all the dice temperatures are recorded and so on until the fourth die is heated. With the known ambient temperature, the die junction temperature and power dissipation, the thermal resistance can be calculated. The thermal resistance calculation can be cast in matrix form. This yields a 4×4 matrix for our case of two heat sources.
