INTEGRATED CIRCUITS

Preliminary specification File under Integrated Circuits, IC01 May 1991

HILIPS

**TEA6360** 

# 5-band stereo equalizer circuit

#### FEATURES

- Monolithic integrated 5-band stereo equalizer circuit
- Five filters for each channel
- Centre frequency, bandwidth and maximum boost/cut defined by external components
- Choise for variable or constant Q-factor via I<sup>2</sup>C software
- Defeat mode
- All stages are DC-coupled
- I<sup>2</sup>C-bus control for all functions
- Two different modul addresses programmable.

#### **GENERAL DESCRIPTION**

The 5-band stereo equalizer is an  $1^2$ C-bus controlled tone processor for application in car radio sets, TV sets and music centres. It offers the possibility of sound control as well as equalization of sound pressure behaviour of different rooms or loudspeakers, especially in cars.

# TEA6360

#### FUNCTIONAL DESCRIPTION

The TEA6360 is performed with two stereo channels (RIGHT and LEFT), each one consists of five equal filter amplifiers (Fig.1).

The centre frequencies for the different filters as well as the bandwidth and the control ranges for boost and cut depend on the external components. Each filter can have different external components but for one definite pair of filters the centre frequency as well as the control range for boost and cut are the same. That means, they have symmetrical curves for boost and cut.

The control range (maximum value in dB) is divided into five steps and one extra step for the linear position.

At maximum gain of 12 dB the typical step resolution is 2.4 dB. The internal resistor chain of each filter amplifier is optimized for 12 dB maximum gain. Therefore the typical gain factors for 15 dB application are as follows:

step 1	=	2.7	dB
step 2	=	5.5	dB
step 3	=	8.4	dB
step 4	=	11.6	dB
step 5	=	15.0	dB

The control of the different filters is obtained by selecting the appropriate subaddress byte (Table 1).

#### LIMITING VALUES

In accordance with the Absolute Maximum System (IEC 134). Ground pins 19, 28 and 43 connected together.

The position of the filter in the left channel and that in the right channel is always the same (stereo).

The position of the boost part and the cut part is independently controllable (Tables 2 and 3).

The quality factor of the filter has its maximum in the maximum position (steps 5), if boost (cut on step 0) or cut (boost on step 0) is used. The quality factor decreases also with the step number (variable quality factor). In this mode the control pattern are according to Table 4.

A different control is necessary to achieve a constant quality factor over the whole control range. For boost with a constant quality factor over the boost range position +5is selected and boost control is then performed using cut. This control technique is applied to the cut range with position -5 selected and the boost is varied (Table 5).

The cut part has to follow the boost part in each filter for economic reasons. So the signal is first amplified and then attenuated. This has to be taken into account for the internal level diagram in case of constant quality factor. This may result in a mode between constant Q and non-constant Q mode; for example for the position +2 it is not necessary to amplify by step +5 and then attenuate by -3 step. The combination of step +4 and step -2 to reach position +2 is a good result (quasi constant quality factor, Table 6).

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
V <sub>P</sub>	supply voltage (pin 14)	0	13.2	V
V <sub>n</sub>	voltage on all pins, grounds excluded	0	V <sub>P</sub>	V
P <sub>tot</sub>	total power dissipation	0	500	mW
T <sub>stg</sub>	storage temperature range	-40	150	°C
	storage temperature range	-40	150	°C
T <sub>amb</sub>	operating ambient temperature range	-40	85	°C
V <sub>ESD</sub>	electrostatic handling <sup>(1)</sup> for all pins		±500	V

#### Note

1. Equivalent to discharging a 200 pF capacitor through a 0  $\Omega$  series resistor.

## TEA6360

#### CHARACTERISTICS

 $V_P = 8.5 \text{ V}$ ;  $f_i = 1 \text{ kHz}$  ( $R_S = 600 \Omega$ ),  $R_L = 10 \text{ k}\Omega$ ,  $T_{amb} = 25 \text{ °C}$  and measurements taken in Fig.1, unless otherwise specified.

#### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

#### SDIP

#### SOLDERING BY DIPPING OR BY WAVE

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg max}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

#### REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

#### SO

#### REFLOW SOLDERING

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250  $^{\circ}\text{C}.$ 

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

#### WAVE SOLDERING

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### REPAIRING SOLDERED JOINTS

Fix the component by first soldering two diagonallyopposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

#### LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

#### PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
