

## 16 MHz rail-to-rail CMOS 16 V operational amplifiers

Datasheet - production data

## Features

- Rail-to-rail input and output
- Wide supply voltage: 4 V - 16 V
- Gain bandwidth product: 16 MHz typ at 16 V
- Low power consumption: 2.8 mA typ at 16 V
- Slew rate: 27 V/ $\mu$ s
- Stable when used in gain configuration
- Low input bias current: 10 pA typ
- High tolerance to ESD: 4 kV HBM
- Extended temperature range:  
-40° C to +125° C
- Automotive qualification

## Related products

- See the TSX5 series for low power features
- See the TSX6 series for micro power features
- See the TSX92 series for unity gain stability
- See the TSV9 series for lower voltage

## Applications

- Communications
- Process control
- Active filtering
- Test equipment

## Description

The TSX9291 and TSX9292 operational amplifiers (op amps) offer excellent AC characteristics such as 16 MHz gain bandwidth, 27 V/ $\mu$ s slew rate, and 0.0003 % THD+N. They are decompensated amplifiers which are stable when used with a gain higher than 2 or lower than -1. The rail-to-rail input and output capability of these devices operates on a wide supply voltage range of 4 V to 16 V. These last two features make the TSX929x series particularly well-adapted for a wide range of applications such as communications, I/V amplifiers for ADCs, and active filtering applications.

## 2 Absolute maximum ratings and operating conditions

**Table 2. Absolute maximum ratings (AMR)**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	18	V
$V_{id}$	Differential input voltage <sup>(2)</sup>	$\pm V_{CC}$	mV
$V_{in}$	Input voltage	$V_{CC-} - 0.2$ to $V_{CC+} + 0.2$	V
$I_{in}$	Input current <sup>(3)</sup>	10	mA
$T_{stg}$	Storage temperature	-65 to +150	°C
$R_{thja}$	Thermal resistance junction to ambient <sup>(4)(5)</sup> SOT23-5 DFN8 2x2 MiniSO8 SO8	250 57 190 125	°C/W
$T_j$	Maximum junction temperature	150	°C
ESD	HBM: human body model <sup>(6)</sup>	4000	V
	MM: machine model <sup>(7)</sup>	100	
	CDM: charged device model <sup>(8)</sup>	1500	
	Latch-up immunity	200	mA

1. All voltage values, except the differential voltage are with respect to network ground terminal.
2. The differential voltage is the non-inverting input terminal with respect to the inverting input terminal.
3. Input current must be limited by a resistor in series with the inputs.
4. Short-circuits can cause excessive heating and destructive dissipation.
5.  $R_{th}$  are typical values.
6. According to JEDEC standard JESD22-A114F
7. According to JEDEC standard JESD22-A115A
8. According to ANSI/ESD STM5.3.1

**Table 3. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	4 to 16	V
$V_{icom}$	Common mode input voltage range	$V_{CC-} - 0.1$ to $V_{CC+} + 0.1$	
$T_{oper}$	Operating free air temperature range	-40 to +125	°C

THD+N	Total harmonic distortion + noise	$f = 1\text{ kHz}$ , $A_v = +1$ , $R_L = 10\text{ k}\Omega$ , $V_{out} = 2\text{ V}_{rms}$		0.002		%

1. Typical value is based on the  $V_{io}$  drift observed after 1000h at 125°C extrapolated to 25°C using the Arrhenius law and assuming an activation energy of 0.7 eV. The operational amplifier is aged in follower mode configuration. See [Section 4.6: Long-term input offset voltage drift](#).
2. When used in comparator mode, with high differential input voltage, during a long period of time with  $V_{CC}$  close to 16V and  $V_{icm} > V_{CC}/2$ ,  $V_{io}$  can experience a permanent drift of few mV drift. The phenomenon is particularly worsen at low temperatures.

**Table 5. Electrical characteristics at  $V_{CC+} = +10$  V with  $V_{CC-} = 0$  V,  $V_{icm} = V_{CC}/2$ ,  $T_{amb} = 25^\circ C$ , and  $R_L = 10 \text{ k}\Omega$  connected to  $V_{CC}/2$  (unless otherwise specified)**

## 4 Application information

### 4.1 Operating voltages

The TSX929x series of operation amplifiers can operate from 4 V to 16 V. Parameters are fully specified at 4.5 V, 10 V, and 16 V power supplies. However, parameters are very stable in the full  $V_{CC}$  range. Additionally, the main specifications are guaranteed in the extended temperature range of -40 to +125 °C.

### 4.2 Rail-to-rail input

The TSX9291 and TSX9292 are designed with two complementary PMOS and NMOS input differential pairs. The devices have a rail-to-rail input and the input common mode range is extended from  $(V_{CC-}) - 0.1$  V to  $(V_{CC+}) + 0.1$  V. However, the performance of these devices is clearly optimized for the PMOS differential pairs (which means from  $(V_{CC-}) - 0.1$  V to  $(V_{CC+}) - 2$  V).

Beyond  $(V_{CC+}) - 2$  V, the operational amplifiers are still functional but with downgraded performances (see [Figure 19](#)). Performances are still suitable for a large number of applications requiring the rail-to-rail input feature.

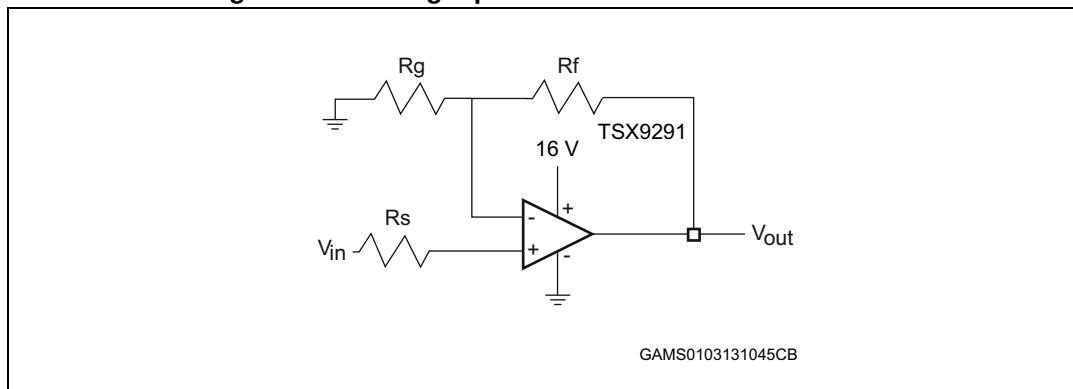

TSX9291 and TSX9292 are designed to prevent phase reversal.

### 4.3 Input pin voltage range

The TSX929x series has internal ESD diode protection on the inputs. These diodes are connected between the input and each supply rail to protect MOSFETs inputs from electrostatic discharges.

Thus, if the input pin voltage exceeds the power supply by 0.5 V, the ESD diodes become conductive and excessive current could flow through them. To prevent any permanent damage, this current must be limited to 10 mA. This can be done by adding a resistor,  $R_s$ , in series with the input pin ([Figure 35](#)). The  $R_s$  resistor value has to be calculated for a 10 mA current limitation on the input pins.

**Figure 35. Limiting input current with a series resistor**

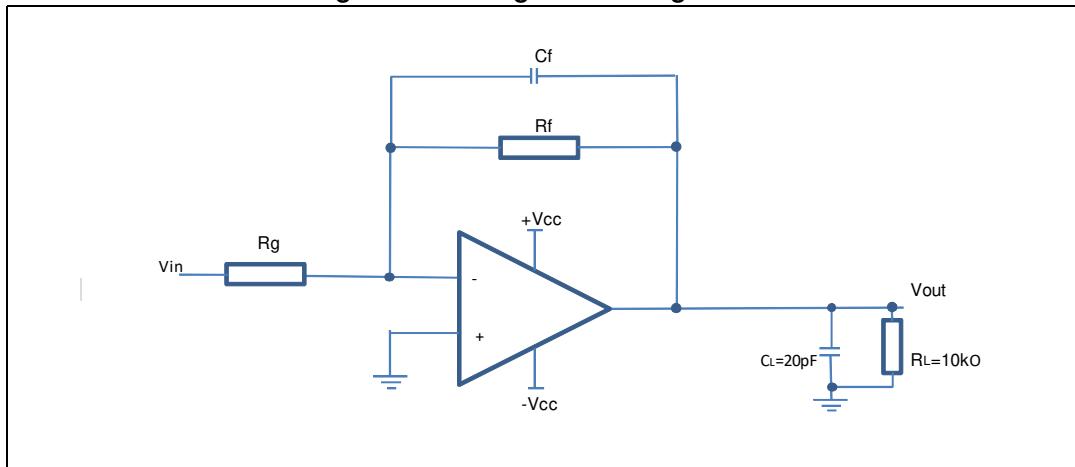

## 4.4 Stability for gain = -1

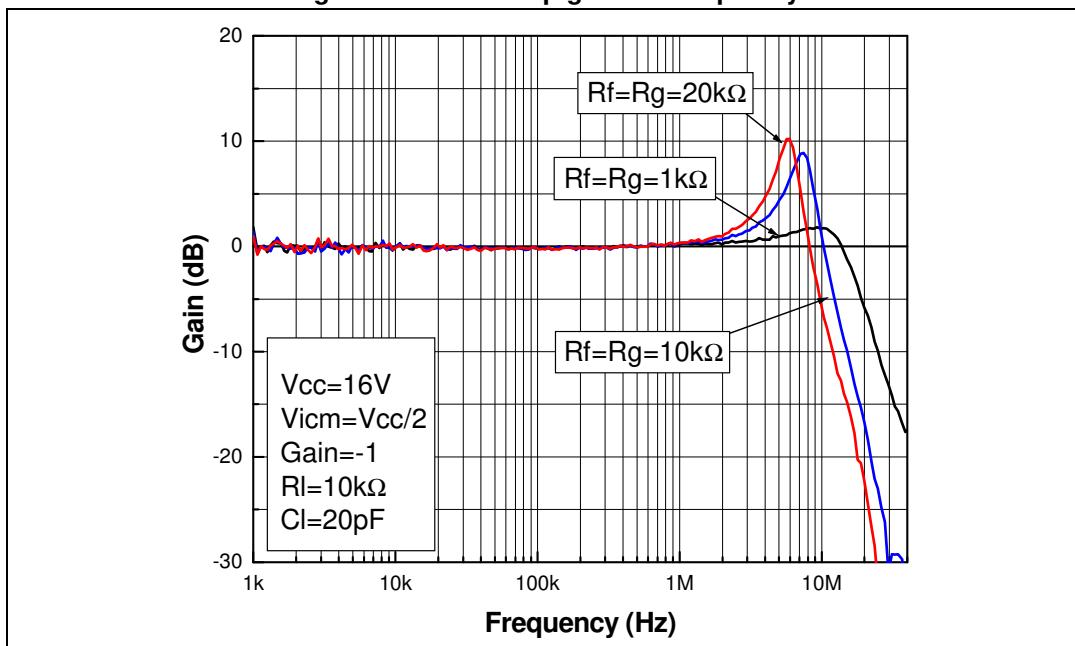

TSX9291 and TSX9292 can be used in gain = -1 configuration (see *Figure 36*). However some precautions must be taken regarding the setting of the  $R_g$  and  $R_f$  resistors. Effectively, the input capacitance of the TSX929x series creates a pole with  $R_f$  and  $R_g$ . In high frequency, this pole decreases the phase margin and also causes gain peaking. This effect has a direct impact on the stability.

*Figure 37* shows the peaking, depending on the values of the gain and feedback resistances.

**Figure 36. Configuration for gain = -1**

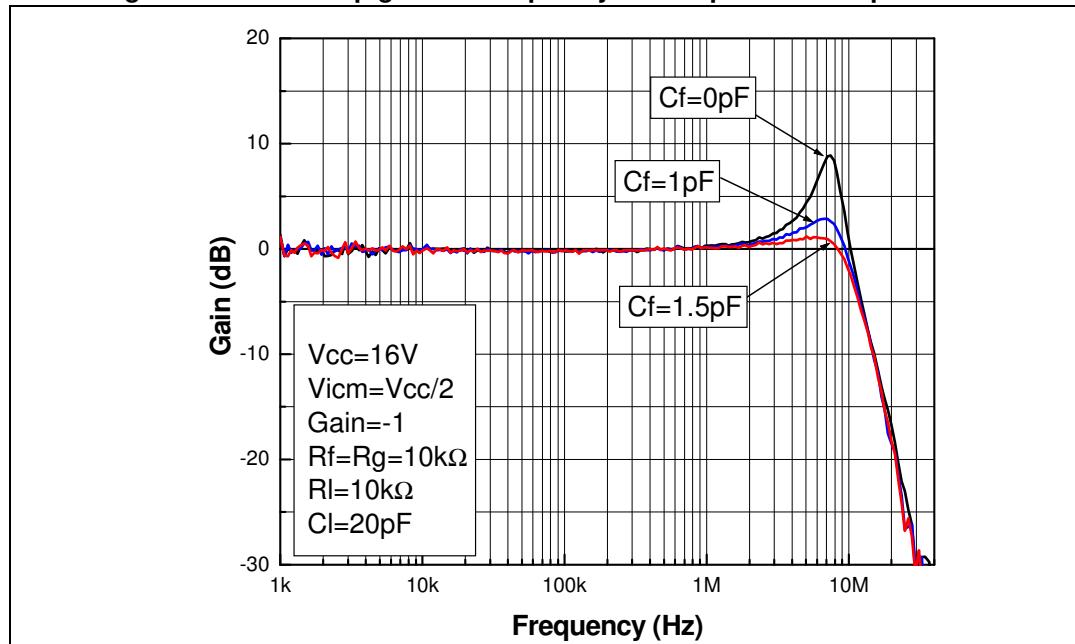

**Figure 37. Close loop gain vs. frequency**

Whenever possible, it is best to choose smaller feedback resistors. It is recommended to use 1 kΩ gain and feedback resistance ( $R_f$  and  $R_g$ ) when gain = -1 is necessary. In the application, if a large value of  $R_f$  and  $R_g$  has to be used, a feedback capacitance can be added in parallel with  $R_f$ , to reduce or eliminate the gain peaking. Additionally,  $C_f$  helps to compensate the input capacitance and to increase stability.

*Figure 38* shows how  $C_f$  reduces the gain peaking.

**Figure 38. Close loop gain vs. frequency with capacitive compensation**

## 4.5 Input offset voltage drift over temperature

The maximum input voltage drift over the temperature variation is defined as the offset variation related to offset value measured at 25 °C. The operational amplifier is one of the main circuits of the signal conditioning chain, and the amplifier input offset is a major contributor to the chain accuracy. The signal chain accuracy at 25 °C can be compensated during production at application level. The maximum input voltage drift over temperature enables the system designer to anticipate the effect of temperature variations.

The maximum input voltage drift over temperature is computed using *Equation 1*.

**Equation 1**

$$\frac{\Delta V_{io}}{\Delta T} = \max \left| \frac{V_{io}(T) - V_{io}(25^\circ\text{C})}{T - 25^\circ\text{C}} \right|$$

with  $T = -40$  °C and 125 °C.

The datasheet maximum value is guaranteed by a measurement on a representative sample size ensuring a  $C_{pk}$  (process capability index) greater than 2.

## 4.6 Long-term input offset voltage drift

To evaluate product reliability, two types of stress acceleration are used:

- Voltage acceleration, by changing the applied voltage
- Temperature acceleration, by changing the die temperature (below the maximum junction temperature allowed by the technology) with the ambient temperature.

The voltage acceleration has been defined based on JEDEC results, and is defined using [Equation 2](#).

### Equation 2

$$A_{FV} = e^{\beta \cdot (V_S - V_U)}$$

Where:

$A_{FV}$  is the voltage acceleration factor

$\beta$  is the voltage acceleration constant in 1/V, constant technology parameter ( $\beta = 1$ )

$V_S$  is the stress voltage used for the accelerated test

$V_U$  is the voltage used for the application

The temperature acceleration is driven by the Arrhenius model, and is defined in [Equation 3](#).

### Equation 3

$$A_{FT} = e^{\frac{E_a}{k} \cdot \left( \frac{1}{T_U} - \frac{1}{T_S} \right)}$$

Where:

$A_{FT}$  is the temperature acceleration factor

$E_a$  is the activation energy of the technology based on the failure rate

$k$  is the Boltzmann constant ( $8.6173 \times 10^{-5}$  eV.K $^{-1}$ )

$T_U$  is the temperature of the die when  $V_U$  is used (K)

$T_S$  is the temperature of the die under temperature stress (K)

The final acceleration factor,  $A_F$ , is the multiplication of the voltage acceleration factor and the temperature acceleration factor ([Equation 4](#)).

### Equation 4

$$A_F = A_{FT} \times A_{FV}$$

$A_F$  is calculated using the temperature and voltage defined in the mission profile of the product. The  $A_F$  value can then be used in [Equation 5](#) to calculate the number of months of use equivalent to 1000 hours of reliable stress duration.

**Equation 5**

$$\text{Months} = A_F \times 1000 \text{ h} \times 12 \text{ months} / (24 \text{ h} \times 365.25 \text{ days})$$

To evaluate the op amp reliability, a follower stress condition is used where  $V_{CC}$  is defined as a function of the maximum operating voltage and the absolute maximum rating (as recommended by JEDEC rules).

The  $V_{IO}$  drift (in  $\mu\text{V}$ ) of the product after 1000 h of stress is tracked with parameters at different measurement conditions (see [Equation 6](#)).

**Equation 6**

$$V_{CC} = \max V_{op} \text{ with } V_{icm} = V_{CC}/2$$

The long-term drift parameter ( $\Delta V_{IO}$ ), estimating the reliability performance of the product, is obtained using the ratio of the  $V_{IO}$  (input offset voltage value) drift over the square root of the calculated number of months ([Equation 7](#)).

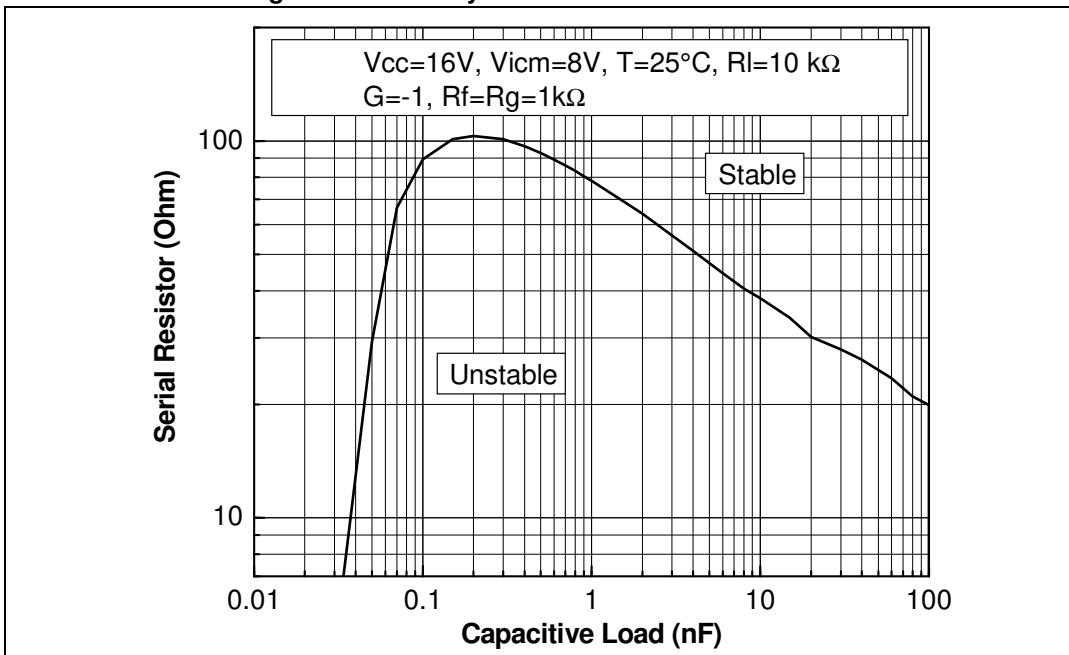

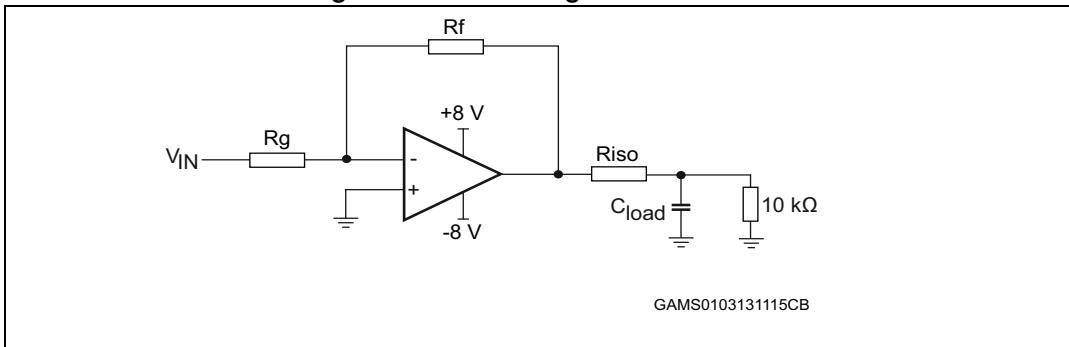

**Equation 7**

$$\Delta V_{IO} = \frac{V_{IO} \text{ drift}}{\sqrt{(\text{months})}}$$

where  $V_{IO}$  drift is the measured drift value in the specified test conditions after 1000 h stress duration.

**4.7****Capacitive load**

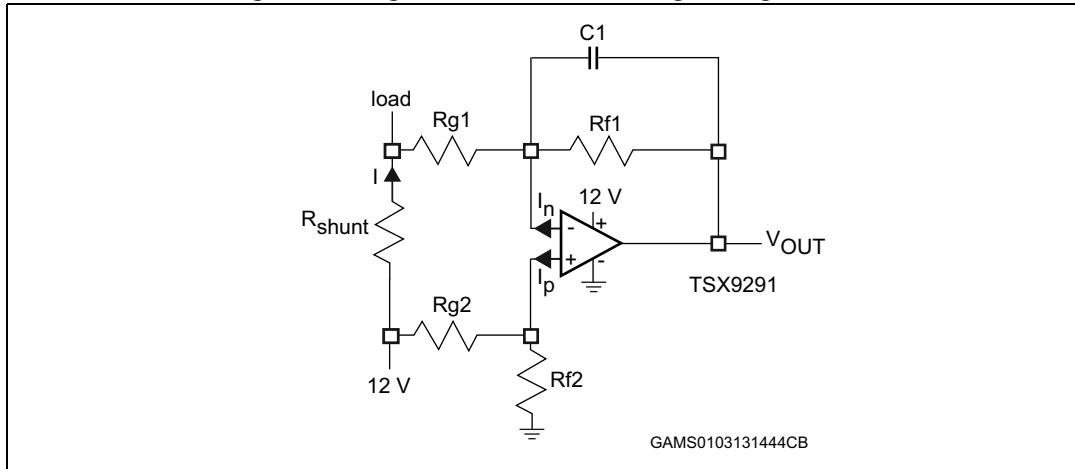

Driving a large capacitive load can cause stability issues. Increasing the load capacitance produces gain peaking in the frequency response, with overshooting and ringing in the step response. It is usually considered that with a gain peaking higher than 2.3 dB the op amp might become unstable. Generally, the unity gain configuration is the worst configuration for stability and the ability to drive large capacitive loads. [Figure 39](#) shows the serial resistor (Riso) that must be added to the output, to make the system stable. [Figure 40](#) shows the test configuration for Riso.

**Figure 39. Stability criteria with a serial resistor****Figure 40. Test configuration for Riso**

## 4.8 High side current sensing

TSX9291 and TSX9292 rail to rail input devices can be used to measure a small differential voltage on a high side shunt resistor and translate it into a ground referenced output voltage. The gain is fixed by external resistance.

**Figure 41. High side current sensing configuration**

$V_{OUT}$  can be expressed as shown in [Equation 8](#).

**Equation 8**

$$V_{out} = R_{shunt} \times I \left( 1 - \frac{R_{g2}}{R_{g2} + R_{f2}} \right) \left( 1 + \frac{R_{f1}}{R_{g1}} \right) + I_p \left( \frac{R_{g2} R_{f2}}{R_{g2} + R_{f2}} \right) \times \left( 1 + \frac{R_{f1}}{R_{g1}} \right) - I_n \times R_{f1} - V_{io} \left( 1 + \frac{R_{f1}}{R_{g1}} \right)$$

Assuming that  $R_{f2} = R_{f1} = R_f$  and  $R_{g2} = R_{g1} = R_g$ , [Equation 8](#) can be simplified as [Equation 9](#).

**Equation 9**

$$V_{out} = R_{shunt} \times I \left( \frac{R_f}{R_g} \right) - V_{io} \left( 1 + \frac{R_f}{R_g} \right) + R_f \times I_{io}$$

With the TSX929x series, the high side current measurement must be made by respecting the common mode voltage of the amplifier:  $(V_{CC-}) - 0.1V$  to  $(V_{CC+}) + 0.1V$ . If the application requires a higher common voltage, please refer to the TSC high side current sensing family.

## 4.9 High speed photodiode

The TSX929x series is an excellent choice for current to voltage (I-V) conversions. Due to the CMOS technology, the input bias currents are extremely low. Moreover, the low noise and high unity-gain bandwidth of TSX9291 TSX9292 make them particularly suitable for high-speed photodiode preamplifier applications.

The photodiode is considered as a capacitive current source. The input capacitance,  $C_{IN}$ , includes the parasitic input common mode capacitance,  $C_{CM}$  (3pF), and the input differential mode capacitance,  $C_{DIFF}$  (8pF).  $C_{IN}$  acts in parallel with the intrinsic capacitance of the photodiode,  $C_D$ . At higher frequencies, the capacitors affect the circuit response. The output capacitance of a current sensor has a strong effect on the stability of the op amp feedback loop.

$C_F$  stabilizes the gain and limits the transimpedance bandwidth. To ensure good stability and to obtain good noise performance,  $C_F$  can be set as shown in [Equation 10](#).

### Equation 10

$$C_F > \sqrt{\frac{C_{IN} + C_D}{2 \cdot \pi \cdot R_F \cdot F_{GBP}}} - C_{SMR}$$

where,

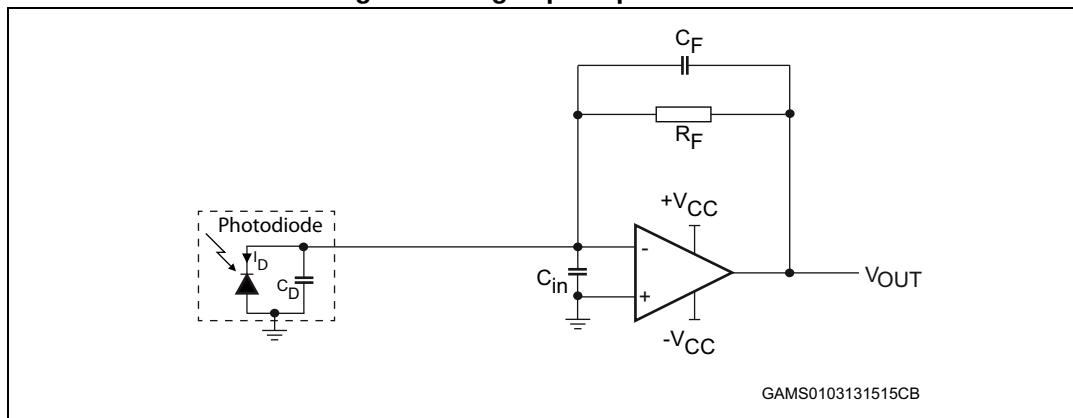

- $C_{IN} = C_{CM} + C_{DIFF} = 11 \text{ pF}$
- $C_{DIFF}$  is the differential input capacitance: 8 pF typical
- $C_{CM}$  is the Common mode input capacitance: 3 pF typical
- $C_D$  is the intrinsic capacitance of the photodiode
- $C_{SMR}$  is the parasitic capacitance of the surface mount  $R_F$  resistor: 0.2 pF typical
- $F_{GBP}$  is the gain bandwidth product: 10 MHz at 16 V

$R_F$  fixes the gain as shown in [Equation 11](#).

### Equation 11

$$V_{OUT} = R_F \times I_D$$

Figure 42. High speed photodiode

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com).  
ECOPACK is an ST trademark.
