Data Sheet

Description

Avago Technologies' ALM-1322 is a very low noise, high gain balanced amplifier module operating in the 1.8 to 2.2GHz frequency range. The exceptional noise performance is achieved through the use of Avago Technologies' proprietary 0.5um GaAs Enhancement-mode pHEMT process.

The ALM-1322 is housed in a miniature 5.0 x 6.0 x 1.1 mm³ 22-lead multiple-chips-on-board(MCOB) module package. The compact footprint and low profile makes this product an ideal choice for Wireless Infrastructure Basestation Tower-Mounted Amplifiers (TMA), Radiocards and Multi-Carrier Driver Amplifiers in the cellular/PCS/CDMA bands.

$$\theta_{jc} = 27 \text{ } ^\circ\text{C/W}$$

Notes:

2. Operation of this device in excess of any of these limits may cause permanent damage.
3. Thermal resistance measured using Infra-Red Measurement Technique.
4. Board (module belly) temperature TB is 25°C. Derate 37mW/°C for TB>123°C.

Note:

5. Distribution data sample size is 500 samples taken from 3 different wafers and 3 different lots. Future wafers allocated to this product may have nominal values anywhere between the upper and lower limits.
6. Measurements are made on a production test board, which can show a variance of up to 1dB in gain and OIP3 compared to a soldered-down demo board. Input trace losses have been de-embedded from actual measurements.
