# **ST-NXP Wireless**

### **IMPORTANT NOTICE**

Dear customer,

As from August 2<sup>nd</sup> 2008, the wireless operations of NXP have moved to a new company, ST-NXP Wireless.

As a result, the following changes are applicable to the attached document.

- Company name NXP B.V. is replaced with ST-NXP Wireless.
- **Copyright** the copyright notice at the bottom of each page "© NXP B.V. 200x. All rights reserved", shall now read: "© ST-NXP Wireless 200x All rights reserved".
- Web site <u>http://www.nxp.com</u> is replaced with <u>http://www.stnwireless.com</u>
- **Contact information** the list of sales offices previously obtained by sending an email to <u>salesaddresses@nxp.com</u>, is now found at <u>http://www.stnwireless.com</u> under Contacts.

If you have any questions related to the document, please contact our nearest sales office. Thank you for your cooperation and understanding.

ST-NXP Wireless

Low-power FM stereo radio for handheld applications

Rev. 05 — 26 January 2007

**Product data sheet** 

### 1. General description

The TEA5767HN is a single-chip electronically tuned FM stereo radio for low-voltage applications with fully integrated Intermediate Frequency (IF) selectivity and demodulation. The radio is completely adjustment-free and only requires a minimum of small and low cost external components. The radio can be tuned to the European, US, and Japanese FM bands.

### 2. Features

- High sensitivity due to integrated low-noise RF input amplifier
- FM mixer for conversion to IF of the US/Europe (87.5 MHz to 108 MHz) and Japanese (76 MHz to 91 MHz) FM band
- Preset tuning to receive Japanese TV audio up to 108 MHz
- RF Automatic Gain Control (AGC) circuit
- LC tuner oscillator operating with low cost fixed chip inductors
- FM IF selectivity performed internally
- No external discriminator needed due to fully integrated FM demodulator
- Crystal reference frequency oscillator; the oscillator operates with a 32.768 kHz clock crystal or with a 13 MHz crystal and with an externally applied 6.5 MHz reference frequency
- Phase-locked loop (PLL) synthesizer tuning system
- I<sup>2</sup>C-bus and 3-wire bus, selectable via pin BUSMODE
- 7-bit IF counter output via the bus
- 4-bit level information output via the bus
- Soft mute
- Signal dependent mono to stereo blend [Stereo Noise Cancelling (SNC)]
- Signal dependent High Cut Control (HCC)
- Soft mute, SNC and HCC can be switched off via the bus
- Adjustment-free stereo decoder
- Autonomous search tuning function
- Standby mode
- Two software programmable ports
- Bus enable line to switch the bus input and output lines into 3-state mode

### Low-power FM stereo radio for handheld applications

### 3. Quick reference data

### Table 1. Quick reference data

Symbol	Parameter	Conditions		Min	Тур	Мах	Unit

### 7. Functional description

### 7.1 Low-noise RF amplifier

The Low Noise Amplifier (LNA) input impedance together with the LC RF input circuit defines an FM band filter. The gain of the LNA is controlled by the RF AGC circuit.

### 7.2 FM mixer

The FM quadrature mixer converts the FM RF (76 MHz to 108 MHz) to an IF of 225 kHz.

### 7.3 VCO

The varactor tuned LC VCO provides the Local Oscillator (LO) signal for the FM quadrature mixer. The VCO frequency range is 150 MHz to 217 MHz.

#### Low-power FM stereo radio for handheld applications

### 7.4 Crystal oscillator

The crystal oscillator can operate with a 32.768 kHz clock crystal or a 13 MHz crystal. The temperature drift of standard 32.768 kHz clock crystals limits the operational temperature range from -10 °C to +60 °C.

The PLL synthesizer can be clocked externally with a 32.768 kHz, a 6.5 MHz or a 13 MHz signal via pin XTAL2.

The crystal oscillator generates the reference frequency for:

- The reference frequency divider for the synthesizer PLL
- The timing for the IF counter
- The free-running frequency adjustment of the stereo decoder VCO
- The center frequency adjustment of the IF filters

### 7.5 PLL tuning system

The PLL synthesizer tuning system is suitable to operate with a 32.768 kHz or a 13 MHz reference frequency generated by the crystal oscillator or applied to the IC from an external source. The synthesizer can also be clocked via pin XTAL2 at 6.5 MHz. The PLL tuning system can perform an autonomous search tuning function.

### 7.6 RF AGC

The RF AGC prevents overloading and limits the amount of intermodulation products created by strong adjacent channels.

### 7.7 IF filter

Fully integrated IF filter.

### 7.8 FM demodulator

The FM quadrature demodulator has an integrated resonator to perform the phase shift of the IF signal.

### 7.9 Level voltage generator and analog-to-digital converter

The FM IF analog level voltage is converted to 4 bits digital data and output via the bus.

### 7.10 IF counter

The IF counter outputs a 7-bit count result via the bus.

### 7.11 Soft mute

The low-pass filtered level voltage drives the soft mute attenuator at low RF input levels. The soft mute function can be switched off via the bus.

### 7.12 MPX decoder

The PLL stereo decoder is adjustment-free. The stereo decoder can be switched to mono via the bus.

### Low-power FM stereo radio for handheld applications

### 7.13 Signal dependent mono to stereo blend

With a decreasing RF input level the MPX decoder blends from stereo to mono to limit the output noise. The continuous mono to stereo blend can also be programmed via the bus to an RF level depending switched mono to stereo transition. Stereo Noise Cancelling (SNC) can be switched off via the bus.

### 7.14 Signal dependent AF response

The audio bandwidth will be reduced with a decreasing RF input level. This function can be switched off via the bus.

### 7.15 Software programmable ports

Two software programmable ports (open-collector) can be addressed via the bus.

The port 1 (pin SWPORT1) function can be changed with write data byte 4 bit 0 (see Table 13). Pin SWPORT1 is then output for the ready flag of read byte 1.

### 7.16 I<sup>2</sup>C-bus and 3-wire bus

The 3-wire bus and the I<sup>2</sup>C-bus operate with a maximum clock frequency of 400 kHz.

Before any READ or WRITE operation the pin BUSENABLE has to be HIGH for at least 10  $\mu s.$ 

The I<sup>2</sup>C-bus mode is selected when pin BUSMODE is LOW, when pin BUSMODE is HIGH the 3-wire bus mode is selected.

### 8. I<sup>2</sup>C-bus, 3-wire bus and bus-controlled functions

### 8.1 I<sup>2</sup>C-bus specification

Information about the I<sup>2</sup>C-bus can be found in the brochure *"The I<sup>2</sup>C-bus and how to use it" (order number 9398 393 40011).* 

The standard I<sup>2</sup>C-bus specification is expanded by the following definitions:

IC address: 110 0000b

Structure of the I<sup>2</sup>C-bus logic: slave transceiver

Subaddresses are not used

The maximum LOW-level input and the minimum HIGH-level input are specified to  $0.2V_{CCD}$  and  $0.45V_{CCD}$  respectively.

The pin BUSMODE must be connected to ground to operate the IC with the I<sup>2</sup>C-bus.

**Remark:** The I<sup>2</sup>C-bus operates at a maximum clock frequency of 400 kHz. It is not allowed to connect the IC to an I<sup>2</sup>C-bus operating at a higher clock rate.

### 8.1.1 Data transfer

Data sequence: address, byte 1, byte 2, byte 3, byte 4 and byte 5 (the data transfer has to be in this order). The Least Significant Bit (LSB) = 0 of the address indicates a WRITE operation to the TEA5767HN.

Bit 7 of each byte is considered as the Most Significant Bit (MSB) and has to be transferred as the first bit of the byte.

The data becomes valid bitwise at the appropriate falling edge of the clock. A STOP condition after any byte can shorten transmission times.

When writing to the transceiver by using the STOP condition before completion of the whole transfer:

- The remaining bytes will contain the old information
- If the transfer of a byte is not completed, the new bits will be used, but a new tuning cycle will not be started

The IC can be switched into a low current Standby mode with the standby bit; the bus is then still active. The standby current can be reduced by deactivating the bus interface (pin BUSENABLE LOW). If the bus interface is deactivated (pin BUSENABLE LOW) without the Standby mode being programmed, the IC maintains normal operation, but is isolated from the bus lines.

The software programmable output (SWPORT1) can be programmed to operate as a tuning indicator output. As long as the IC has not completed a tuning action, pin SWPORT1 remains LOW. The pin becomes HIGH, when a preset or search tuning is completed or when a band limit is reached.

The reference frequency divider of the synthesizer PLL is changed when the MSB in byte 5 is set to logic 1. The tuning system can then be clocked via pin XTAL2 at 6.5 MHz.

### Low-power FM stereo radio for handheld applications

### 8.1.2 Power-on reset

At Power-on reset the mute is set, all other bits are set to LOW. To initialize the IC all bytes have to be transferred.

### 8.2 I<sup>2</sup>C-bus protocol

S <sup>(1)</sup>	ADDRESS (WRITE)	A(2)	DATA BYTE(S)	A(2)	P(3)

IC address							Mode
1	1	0	0	0	0	0	R/W[1]

[1] Read or write mode:

- a) 0 = write operation to the TEA5767HN.
- b) 1 = read operation from the TEA5767HN.

#### Low-power FM stereo radio for handheld applications

#### Fig 6. I<sup>2</sup>C-bus timing diagram

### 8.3 3-wire bus specification

The 3-wire bus controls the write/read, clock and data lines and operates at a maximum clock frequency of 400 kHz.

**Hint:** By using the standby bit the IC can be switched into a low current Standby mode. In Standby mode the IC must be in the WRITE mode. When the IC is switched to READ mode, during standby, the IC will hold the data line down. The standby current can be reduced by deactivating the bus interface (pin BUSENABLE LOW). If the bus interface is deactivated (pin BUSENABLE LOW) without the Standby mode being programmed, the IC maintains normal operation, but is isolated from the clock and data line.

### 8.3.1 Data transfer

Data sequence: byte 1, byte 2, byte 3, byte 4 and byte 5 (the data transfer has to be in this order).

#### Low-power FM stereo radio for handheld applications

A positive edge at pin WRITE/READ enables the data transfer into the IC. The data has to be stable at the positive edge of the clock. Data may change while the clock is LOW and is written into the IC on the positive edge of the clock. Data transfer can be stopped after the transmission of new tuning information with the first two bytes or after each following byte.

A negative edge at pin WRITE/READ enables the data transfer from the IC. The WRITE/READ pin changes while the clock is LOW. With the negative edge at pin WRITE/READ the MSB of the first byte occurs at pin DATA.

The bits are shifted on the negative clock edge to pin DATA and can be read on the positive edge.

To do two consecutive read or write actions, pin WRITE/READ has to be toggled for at least one clock period. When a search tuning request is sent, the IC autonomously starts searching the FM band; the search direction and search stop level can be selected. When a station with a field strength equal to or greater than the stop level is found, the tuning system stops and the ready flag bit is set to HIGH. When, during search, a band limit is reached, the tuning system stops at the band limit and the band limit flag bit is set to HIGH. The ready flag is also set to HIGH in this case.

The software programmable output (SWPORT1) can be programmed to operate as a tuning indicator output. As long as the IC has not completed a tuning action, pin SWPORT1 remains LOW. The pin becomes HIGH, when a preset or search tuning is completed or when a band limit is reached.

The reference frequency divider of the synthesizer PLL is changed when the MSB in byte 5 is set to logic 1. The tuning system can then be clocked via pin XTAL2 at 6.5 MHz.

#### 8.3.2 Power-on reset

At Power-on reset the mute is set, all other bits are random. To initialize the IC all bytes have to be transferred.

[1] Calculation of this 14-bit word can be done as follows:

formula for high side injection: 
$$N = \frac{4 \times (f_{RF} + f_{IF})}{f_{ref}}$$
; formula for low side injection:  $N = \frac{4 \times (f_{RF} - f_{IF})}{f_{ref}}$ 

where:

N = decimal value of PLL word;

f<sub>RF</sub> = the wanted tuning frequency [Hz];

 $f_{IF}$  = the intermediate frequency [Hz] = 225 kHz;

 $f_{ref}$  = the reference frequency [Hz] = 32.768 kHz for the 32.768 kHz crystal;  $f_{ref}$  = 50 kHz for the 13 MHz crystal or when externally clocked with 6.5 MHz.

Example for receiving a channel at 100 MHz with high side injection:  $N = \frac{4 \times 100}{100}$ 

$$\frac{(100 \times 10^6 + 225 \times 10^3)}{32768} = 12234$$

The PLL word becomes 2FCAh.

[2]  $V_{RF}$  in Figure 13 is replaced by  $V_{RF1}$  +  $V_{RF2}$ . The radio is tuned to 98 MHz (high side injection).

[3] Low side and high side selectivity can be switched by changing the mixer from high side to low side LO injection.

### 18. Soldering

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

### **18.1 Introduction to soldering**

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 18.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- · Package footprints, including solder thieves and orientation
- · The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus PbSn soldering

### 18.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- · Solder bath specifications, including temperature and impurities

#### Low-power FM stereo radio for handheld applications

### 18.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 15</u>) than a PbSn process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 35 and 36

#### Table 35. SnPb eutectic process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm <sup>3</sup> )		
	< 350	≥ 350	
< 2.5	235	220	
≥ 2.5	220	220	

#### Table 36. Lead-free process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)				
	Volume (mm <sup>3</sup> )				
	< 350	350 to 2000	> 2000		
< 1.6	260	260	260		
1.6 to 2.5	260	250	245		
> 2.5	250	245	245		

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 15.

### **20. Legal information**

### 20.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

### 20.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

### 20.3 Disclaimers

**General** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of a NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

Terms and conditions of sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <a href="http://www.nxp.com/profile/terms">http://www.nxp.com/profile/terms</a>, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by NXP Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.
