## Single and Dual Low Voltage, Rail-to-Rail Input and Output, Operational Amplifiers

The LMV931 Single and LMV932 Dual are CMOS low-voltage operational amplifiers which can operate on single-sided power supplies (1.8 V to 5.0 V) with rail-to-rail input and output swing. Both devices come in small state-of-the-art packages and require very low quiescent current making them ideal for battery-operated, portable applications such as notebook computers and hand-held instruments. Rail-to-Rail operation provides improved signal-to-noise performance plus the small packages allow for closer placement to signal sources thereby reducing noise pickup.

The single LMV931 is offered in space saving SC70-5 package. The dual LMV932 is in either a Micro8 or SOIC package. These small packages are very beneficial for crowded PCB's.

$V_{IDR}$	Input Differential Voltage	$\pm$ Supply Voltage	V
$V_{ICR}$	Input Common Mode Voltage Range	$-0.5\text{ to }(V_{CC}) + 0.5$	V
	Maximum Input Current	10	mA
$t_{SO}$	Output Short Circuit (Note 1)	Continuous	
$T_J$	Maximum Junction Temperature (Operating Range $-40^\circ\text{C to }85^\circ\text{C}$ )	150	$^\circ\text{C}$
$\theta_{JA}$	Thermal Resistance:	SC-70 TSOP-5 Micro8	$^\circ\text{C/W}$
$T_{stg}$	Storage Temperature	$-65\text{ to }150$	$^\circ\text{C}$
	Mounting Temperature (Infrared or Convection $\leq 30\text{ sec}$ )	260	$^\circ\text{C}$

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

ESD data available upon request.

1. Continuous short-circuit operation to ground at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ . Output currents in excess of 45 mA over long term may adversely affect reliability. Shorting output to either  $V_{CC}$  or  $V_{EE}$  will adversely affect reliability.

## APPLICATION INFORMATION

Figure 29. Voltage Reference

Figure 30. Wien Bridge Oscillator

Figure 31. Comparator with Hysteresis

Given:  $f_o$  = center frequency  
 $A(f_o)$  = gain at center frequency

Choose value  $f_o, C$   
 Then:  $R3 = \frac{Q}{\pi f_o C}$   
 $R1 = \frac{R3}{2 A(f_o)}$   
 $R2 = \frac{R1 R3}{4Q^2 R1 - R3}$

For less than 10% error from operational amplifier,  
 $((Q_o f_o)/BW) < 0.1$  where  $f_o$  and  $BW$  are expressed in Hz.  
 If source impedance varies, filter may be preceded with  
 voltage follower buffer to stabilize filter parameters.
