

# 1:10 LOW JITTER UNIVERSAL BUFFER/LEVEL TRANSLATOR WITH 2:1 INPUT MUX (<1.25 GHz)

## Features

- 10 differential or 20 LVC MOS outputs
- Ultra-low additive jitter: 45 fs rms
- Wide frequency range: dc to 1.25 GHz
- Any-format input with pin selectable output formats: LVPECL, Low Power LVPECL, LVDS, CML, HCSL, LVC MOS
- 2:1 mux with hot-swappable inputs
- Asynchronous output enable
- Output clock division: /1, /2, /4 (/2 and /4 for dc to 725 MHz)
- Low output-output skew: <70 ps
- Low propagation delay variation: <400 ps
- Independent V<sub>DD</sub> and V<sub>DDO</sub>: 1.8/2.5/3.3 V
- Excellent power supply noise rejection (PSRR)
- Selectable LVC MOS drive strength to tailor jitter and EMI performance
- Small size: 44-QFN (7 mm x 7 mm)
- RoHS compliant, Pb-free
- Industrial temperature range: -40 to +85 °C

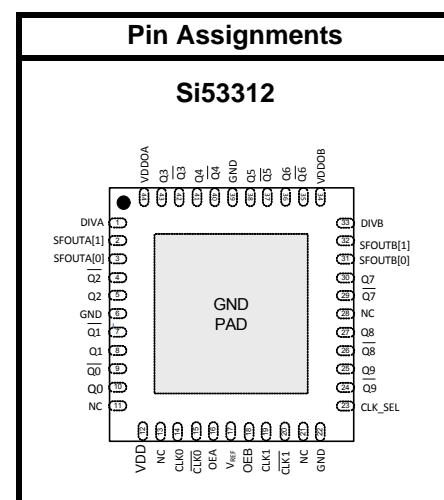

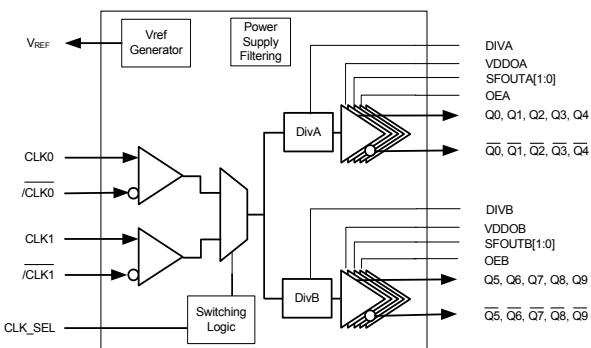

## Applications

- High-speed clock distribution
- Ethernet switch/router
- Optical Transport Network (OTN)
- SONET/SDH
- PCI Express Gen 1/2/3
- Storage
- Telecom
- Industrial
- Servers
- Backplane clock distribution

## Description

The Si53312 is an ultra low jitter ten output differential buffer with pin-selectable output clock signal format and divider selection. The Si53312 features a 2:1 mux, making it ideal for redundant clocking applications. The Si53312 utilizes Silicon Laboratories' advanced CMOS technology to fanout clocks from dc to 1.25 GHz with guaranteed low additive jitter, low skew, and low propagation delay variability. The Si53312 features minimal cross-talk and provides superior supply noise rejection, simplifying low jitter clock distribution in noisy environments. Independent core and output bank supply pins provide integrated level translation without the need for external circuitry.

## 2. Functional Description

The Si53312 is a low jitter, low skew 1:10 differential buffer with an integrated 2:1 input mux. The device has a universal input that accepts most common differential or LVC MOS input signals. A clock select pin is used to select the active input clock. The selected clock input is routed to two independent banks of outputs. Each output bank features control pins to select signal format, output enable, output divider setting and LVC MOS drive strength.

### 2.1. Universal, Any-Format Input

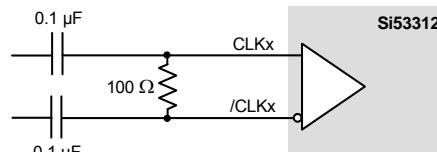

The Si53312 has a universal input stage that enables simple interfacing to a wide variety of clock formats, including LVPECL, LVC MOS, LVDS, HCSL, and CML. Tables 15 and 16 summarize the various input ac- and dc-coupling options supported by the device. Figures 3 and 4 show the recommended input clock termination options.

**Table 15. LVPECL, LVC MOS, and LVDS**

Note: 33 Ohm series termination is optional depending on the location of the receiver.

Figure 4. Differential DC-Coupled Input Terminations

## 2.2. Input Bias Resistors

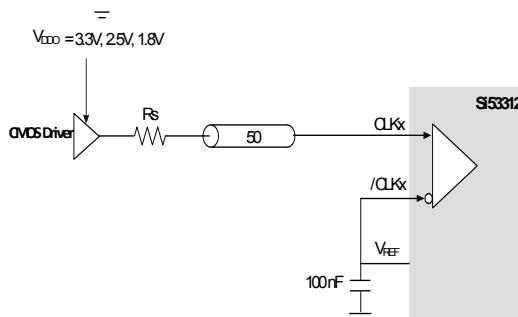

Internal bias resistors ensure a differential output low condition in the event that the clock inputs are not connected. The noninverting input is biased with a  $18.75\text{ k}\Omega$  pulldown to GND and a  $75\text{ k}\Omega$  pullup to  $V_{DD}$ . The inverting input is biased with a  $75\text{ k}\Omega$  pullup to  $V_{DD}$ .

**Figure 5. Input Bias Resistors**

## 2.3. Voltage Reference ( $V_{REF}$ )

The  $V_{REF}$  pin can be used to bias the input receiver, as shown in Figure 6 when a single-ended input clock (such as LVCMS) is used. Note that  $V_{REF} = V_{DD}/2$  and should be compatible with the VCM rating of the single-ended input clock driving the CLK0 or CLK1 inputs. To optimize jitter and duty cycle performance, use the circuit in Figure 3.  $V_{REF}$  pin should be left floating when differential clocks are used.

**Figure 6. Using Voltage Reference with Single-Ended Input Clock**

## 2.4. Universal, Any-Format Output Buffer

The highly flexible output drivers support a wide range of clock signal formats, including LVPECL, low power LVPECL, LVDS, CML, HCSL, and LVCMS. SFOUTx[1] and SFOUTx[0] are 3-level inputs that can be pinstrapped to select the Bank A and Bank B clock signal formats independently. This feature enables the device to be used for format/level translation in addition to clock distribution, minimizing the number of unique buffer part numbers required in a typical application and simplifying design reuse. For EMI reduction applications, four LVCMS drive strength options are available for each  $V_{DDO}$  setting.

**Table 17. Output Signal Format Selection**

SFOUTx[1]	SFOUTx[0]	$V_{DDOX} = 3.3\text{ V}$	$V_{DDOX} = 2.5\text{ V}$	$V_{DDOX} = 1.8\text{ V}$

**\*Note:** SFOUTx[1:0] are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin is internally biased to  $V_{DD}/2$ .

## 2.5. Input Mux and Output Enable Logic

The Si53312 provides two clock inputs for applications that need to select between one of two clock sources. The CLK\_SEL pin selects the active clock input. The table below summarizes the input and output clock based on the input mux and output enable pin settings.

**Table 18. Input Mux and Output Enable Logic**

3. Single-end: Q=low,  $\bar{Q}$ =high  
Differential: Q=low, Q=high

## 2.6. Flexible Output Divider

The Si53312 provides optional clock division in addition to clock distribution. The divider setting for each bank of output clocks is selected via 3-level control pins as shown in the table below. Leaving the DIVx pins open will force a divider value of 1, which is the default mode of operation. Note that when using the on-chip clock divider, a minimum input clock slew rate of 30 mV/ns is required.

**Table 19. Divider Selection**

DIVx <sup>1</sup>	Divider Value
Open <sup>2</sup>	÷1 (default)
0 <sup>3</sup>	÷2
1 <sup>3</sup>	÷4

**Notes:**

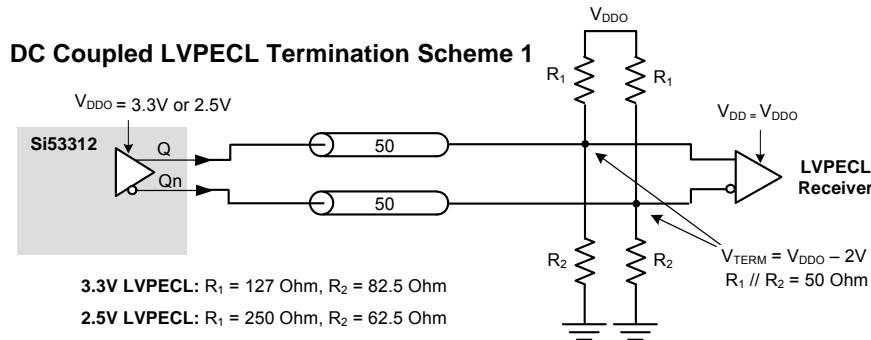

1. DIVx are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin is internally biased to  $V_{DD}/2$ .
2. For frequency range dc to 1.25 GHz.
3. For frequency range dc to 725 MHz.

## 2.7. Power Supply ( $V_{DD}$ and $V_{DDOX}$ )

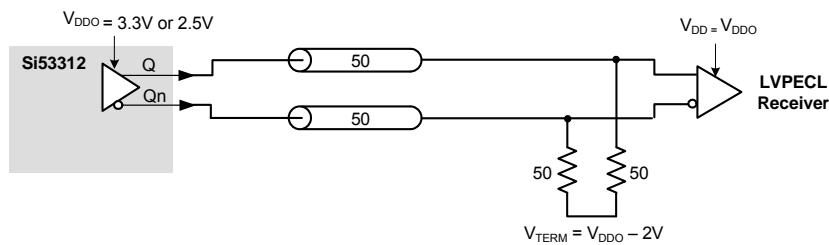

The device includes separate core ( $V_{DD}$ ) and output driver supplies ( $V_{DDOX}$ ). This feature allows the core to operate at a lower voltage than  $V_{DDO}$ , reducing current consumption in mixed supply applications. The core  $V_{DD}$  supports 3.3, 2.5, or 1.8 V. Each output bank has its own  $V_{DDOX}$  supply, supporting 3.3, 2.5, or 1.8 V as defined in Table 1.

## 2.8. Output Clock Termination Options

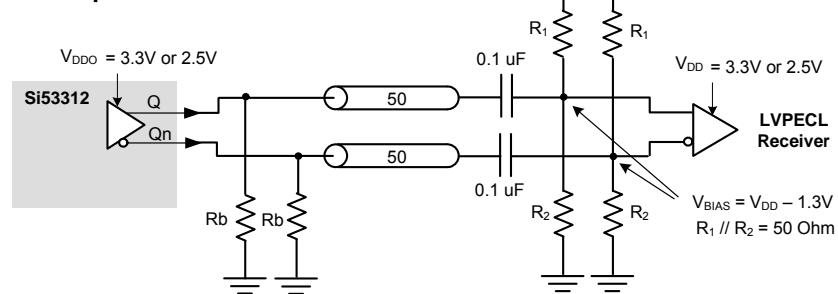

The recommended output clock termination options are shown below.

### 2.8.1. LVC MOS Output Termination To Support 1.5 V and 1.2 V

LVC MOS clock outputs are natively supported at 1.8 V, 2.5 V, and 3.3 V. However, 1.2 V and 1.5 V LVC MOS clock outputs can be supported via a simple resistor divider network that will translate the buffer's 1.8 V output to a lower voltage as shown in Figure 10.

## 2.11. Typical Phase Noise Performance

Each of the following three figures shows three phase noise plots superimposed on the same diagram.

**Source Jitter:** Reference clock phase noise.

**Total Jitter (SE):** Combined source and clock buffer phase noise measured as a single-ended output to the phase noise analyzer and integrated from 12 kHz to 20 MHz.

**Total Jitter (Diff):** Combined source and clock buffer phase noise measured as a differential output to the phase noise analyzer and integrated from 12 kHz to 20 MHz. The differential measurement as shown in each figure is made using a balun. See Figure 1 on page 9.

**Note:** To calculate the total RMS jitter when adding a buffer to your clock tree, use the root-sum-square (RSS).

The total jitter is a measure of the source plus the buffer's additive phase jitter. The additive jitter (rms) of the buffer can then be calculated (via root-sum-square addition).

## 2.13. Power Supply Noise Rejection

The device supports on-chip supply voltage regulation to reject noise present on the power supply, simplifying low jitter operation in real-world environments. This feature enables robust operation alongside FPGAs, ASICs and SoCs and may reduce board-level filtering requirements. For more information, see AN491: “Power Supply Rejection for Low Jitter Clocks”.

Pin #	Name	Description
9	$\overline{Q_0}$	Output clock 0 (complement).
10	$Q_0$	Output clock 0.
11	NC	No connect.
12	$V_{DD}$	Core voltage supply. Bypass with a 1.0 $\mu F$ capacitor placed as close to the pin as possible.
13	NC	No connect.
14	CLK0	Input clock 0.
15	$\overline{CLK_0}$	Input clock 0 (complement). When the CLK0 is driven by a single-end LVCMOS input, connect $\overline{CLK_0}$ to Vdd/2. CLK0 contains an internal pull-up resistor.
16	OEA	Output enable—Bank A. When OEA = high, the Bank A outputs are enabled. When OEA = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OEA is set low. OEA contains an internal pull-up resistor.
17	$V_{REF}$	Reference voltage for single-ended CMOS clocks. $V_{REF}$ is an output voltage and is equal to $V_{DD}/2$ . It can be used to bias the /CLK input for single ended input clocks. See Section 2.3 for more details.
18	OEB	Output enable—Bank B. When OEB = high, the Bank B outputs are enabled. When OEB = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OEB is set low. OEB contains an internal pull-up resistor.
19	CLK1	Input clock 1.
20	$\overline{CLK_1}$	Input clock 1 (complement). When the CLK1 is driven by a single-end LVCMOS input, connect $\overline{CLK_1}$ to Vdd/2. CLK1 contains an internal pull-up resistor.
21	NC	No connect.
22	GND	Ground.
23	CLK_SEL	MUX input select pin (LVCMOS). When CLK_SEL is high, CLK1 is selected. When CLK_SEL is low, CLK0 is selected. CLK_SEL contains an internal pull-down resistor.
24	$\overline{Q_9}$	Output clock 9 (complement).
25	$Q_9$	Output clock 9.
26	$\overline{Q_8}$	Output clock 8 (complement).

Y1	0.75	0.85
Y2	2.85	2.95

**Notes:**

**General**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.

**Solder Mask Design**

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 µm minimum, all the way around the pad.

**Stencil Design**

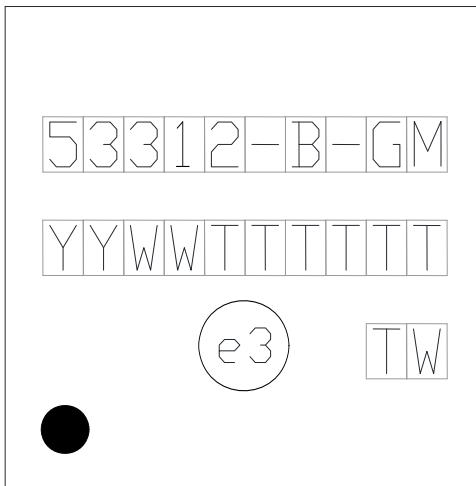

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2x2 array of 1.0 mm square openings on 1.45 mm pitch should be used for the center ground pad.

**Card Assembly**

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

## DOCUMENT CHANGE LIST

### Revision 0.4 to Revision 1.0

- Updated frequency spec from 1MHz to dc.
- Updated operating conditions, including LVC MOS and HCSL voltage support.
- Updated tables 1-11.
- Fixed package error to reflect 44-pin instead of 32-pin throughout document.
- Updated section 2.1-2.12 text descriptions and diagrams.
- Improved data for additive jitter specifications.
- Improved typical phase noise plots.
- Improved performance specifications with more detail.
