

FR60 CY91460G Series 32-bit Microcontroller Datasheet

CY91460G series is a line of general-purpose 32-bit RISC microcontrollers designed for embedded control applications which require high-speed real-time processing, such as consumer devices and on-board vehicle systems. This series uses the FR60 CPU, which is compatible with the FR family of CPUs.

This series contains the LIN-USART and CAN controllers.

Features

FR60 CPU Core

- 32-bit RISC, load/store architecture, five-stage pipeline
- 16-bit fixed-length instructions (basic instructions)
- Instruction execution speed: 1 instruction per cycle
- Instructions including memory-to-memory transfer, bit manipulation, and barrel shift instructions: Instructions suitable for embedded applications
- Function entry/exit instructions and register data multi-load store instructions: Instructions supporting C language

Internal Peripheral Resources

- General-purpose ports : Maximum 205 ports
- DMAC (DMA Controller)
Maximum of 5 channels able to operate simultaneously (including 2 external channels)
- 3 transfer sources (external pin/internal peripheral/software)
Activation source can be selected using software
- Addressing mode specifies full 32-bit addresses (increment/decrement/fixed)
- Transfer mode (demand transfer/burst transfer/step transfer/block transfer)
- Fly-by transfer support (between external I/O and memory)
- Transfer data size selectable from 8/16/32-bit
- Multi-byte transfer enabled (by software)
- DMAC descriptor in I/O areas (200_{H} to 240_{H} , 1000_{H} to 1024_{H})
- A/D converter (successive approximation type)
10-bit resolution: 32 channels
Conversion time: minimum 1 μs
- External interrupt inputs : 16 channels
12 channels shared with CAN RX, I²C SDA or I²C SCL pins
- Bit search module (for REALOS)
Function to search from the MSB (most significant bit) for the position of the first "0", "1", or changed bit in a word
- LIN-USART (full duplex double buffer): 8 channels, 4 channels with FIFO
Clock synchronous/asynchronous selectable
Sync-break detection
Internal dedicated baud rate generator

- Register interlock function: Facilitating assembly-language coding
- Built-in multiplier with instruction-level support
Signed 32-bit multiplication: 5 cycles
Signed 16-bit multiplication: 3 cycles
- Interrupts (save PC/PS): 6 cycles (16 priority levels)
- Harvard architecture enabling program access and data access to be performed simultaneously
- Instructions compatible with the FR family
- I²C bus interface (supports 400 kbps): 4 channel
- Master/slave transmission and reception
- Arbitration function, clock synchronization function
- CAN controller (C-CAN): 6 channels
- Maximum transfer speed: 1 Mbps
- 128 transmission/reception message buffers
- Sound generator: 1 channelTone frequency: PWM frequency divide-by-two (reload value + 1)
- Alarm comparator: 2 channelsMonitor external voltage
Generate an interrupt in case of voltage lower/higher than the defined thresholds (reference voltage)
- 16-bit PPG timer: 16 channels
- 16-bit PFM timer: 1 channel
- 16-bit reload timer: 8 channels
- 16-bit free-run timer: 8 channels (1 channel each for ICU and OCU)
- Input capture: 8 channels (operates in conjunction with the free-run timer)
- Output compare: 8 channels (operates in conjunction with the free-run timer)
- Up/Down counter: 4 channels (4*8-bit or 2*16-bit)
- Watchdog timer
- Real-time clock
- Low-power consumption modes: Sleep/stop mode function
- Low voltage detection circuit

- Clock supervisor
Monitors the sub-clock (32 kHz) and the main clock (4 MHz), and switches to a recovery clock (CR oscillator, etc.) when the oscillations stop.
- Clock modulator
- Clock monitor
- Sub-clock calibration
Corrects the real-time clock timer when operating with the 32 kHz or CR oscillator

Package and Technology

- Package: 320-pin plastic BGA (BGA-320)
- CMOS 0.18 µm technology

- Main oscillator stabilization timer
Generates an interrupt in sub-clock mode after the stabilization wait time has elapsed on the 23-bit stabilization wait time counter

- Sub-oscillator stabilization timer
Generates an interrupt in main clock mode after the stabilization wait time has elapsed on the 15-bit stabilization wait time counter

- Power supply range 3 V to 5 V (1.8 V internal logic provided by a step-down voltage converter)
- Operating temperature range: between –40°C and +125°C

4. I/O Circuit Types

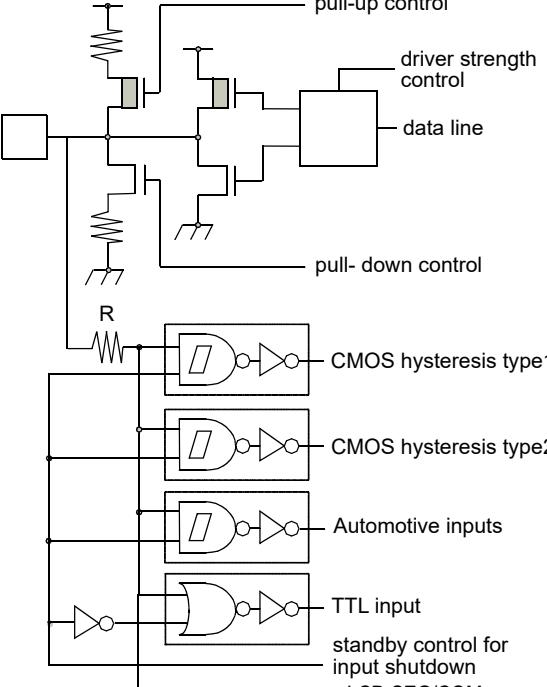

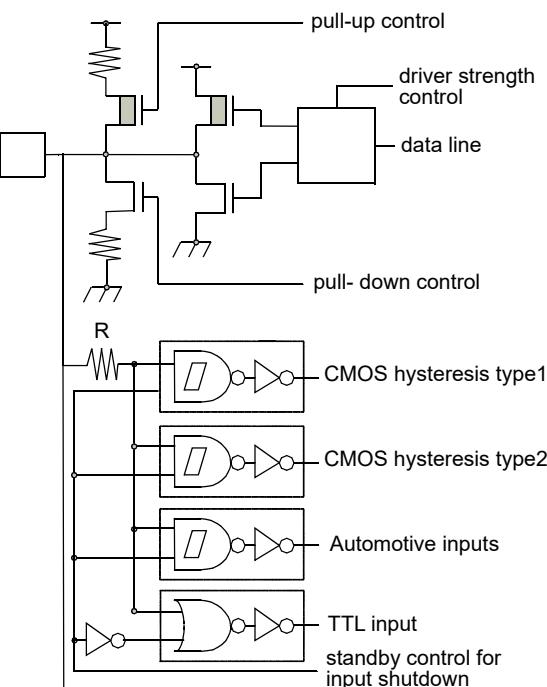

Type	Circuit	Remarks
A	 <p>The circuit diagram illustrates a programmable I/O pin structure. At the top, there is a driver strength control section consisting of two NMOS transistors. Below it is a data line. The data line is controlled by a pull-up control section (an NMOS transistor) and a pull-down control section (a PMOS transistor). A resistor labeled 'R' is connected between the data line and ground. Four separate logic blocks are shown below the driver strength control: 'CMOS hysteresis type1', 'CMOS hysteresis type2', 'Automotive inputs', and 'TTL input'. Each of these blocks contains a D flip-flop followed by an inverter. A 'standby control for input shutdown' section is also present at the bottom.</p>	<p>CMOS level output (programmable $I_{OL} = 5\text{mA}$, $I_{OH} = -5\text{mA}$ and $I_{OL} = 2\text{mA}$, $I_{OH} = -2\text{mA}$)</p> <p>2 different CMOS hysteresis inputs with input shutdown function</p> <p>Automotive input with input shutdown function</p> <p>TTL input with input shutdown function</p> <p>Programmable pull-up resistor: $50\text{k}\Omega$ approx.</p>

5. Handling Devices

5.1 Preventing Latch-up

Latch-up may occur in a CMOS IC if a voltage higher than (V_{DD5} or V_{DD35}) or less than (V_{SS5}) is applied to an input or output pin or if a voltage exceeding the rating is applied between the power supply pins and ground pins. If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Therefore, be very careful not to apply voltages in excess of the absolute maximum ratings.

5.2 Handling of Unused Input Pins

If unused input pins are left open, abnormal operation may result. Any unused input pins should be connected to pull-up or pull-down resistor (2K Ω to 10K Ω) or enable internal pullup or pulldown resistors (PPER/PPCR) before the input enable (PORTEN) is activated by software. The mode pins MD_x can be connected to V_{SS5} or V_{DD5} directly. Unused ALARM input pins can be connected to AV_{SS5} directly.

5.3 Power Supply Pins

In CY91460G series, devices including multiple power supply pins and ground pins are designed as follows; pins necessary to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. All of the power supply pins and ground pins must be externally connected to the power supply and ground respectively in order to reduce unnecessary radiation, to prevent strobe signal malfunctions due to the ground level rising and to follow the total output current ratings. Furthermore, the power supply pins and ground pins of the CY91460G series must be connected to the current supply source via a low impedance.

It is also recommended to connect a ceramic capacitor of approximately 0.1 μ F as a bypass capacitor between power supply pin and ground pin near this device. This series has a built-in step-down regulator. Connect a bypass capacitor of 4.7 μ F (use a X7R ceramic capacitor) to VCC18C pin for the regulator.

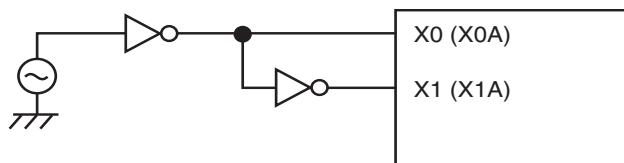

5.4 Crystal Oscillator Circuit

Noise in proximity to the X0 (X0A) and X1 (X1A) pins can cause the device to operate abnormally. Printed circuit boards should be designed so that the X0 (X0A) and X1 (X1A) pins, and crystal oscillator, as well as bypass capacitors connected to ground, are located near the device and ground. It is recommended that the printed circuit board layout be designed such that the X0 and X1 pins or X0A and X1A pins are surrounded by ground plane for the stable operation. Please request the oscillator manufacturer to evaluate the oscillational characteristics of the crystal and this device.

5.5 Notes on Using External Clock

When using the external clock, it is necessary to simultaneously supply the X0 (X0A) and the X1 (X1A) pins. In the described combination, X1 (X1A) should be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. At X0 and X1, a frequency up to 16 MHz is possible.

Figure 1. Example of Using Opposite Phase Supply

5.6 Mode Pins (MD_x)

These pins should be connected directly to the power supply or ground pins. To prevent the device from entering test mode accidentally due to noise, minimize the lengths of the patterns between each mode pin and power supply pin or ground pin on the printed circuit board as possible and connect them with low impedance.

5.7 Notes on Operating in PLL Clock Mode

If the oscillator is disconnected or the clock input stops when the PLL clock is selected, the microcontroller may continue to operate at the free-running frequency of the self-oscillating circuit of the PLL. However, this self-running operation cannot be guaranteed.

5.8 Pull-up Control

The AC standard is not guaranteed in case a pull-up resistor is connected to the pin serving as an external bus pin.

5.9 Notes on PS Register

As the PS register is processed in advance by some instructions, when the debugger is being used, the exception handling may result in execution breaking in an interrupt handling routine or the displayed values of the flags in the PS register being updated. As the microcontroller is designed to carry out reprocessing correctly upon returning from such an EIT event, the operation before and after the EIT always proceeds according to specification.

■ **The following behavior may occur if any of the following occurs in the instruction immediately after a DIV0U/DIV0S instruction:**

- (a) a user interrupt or NMI is accepted;
- (b) single-step execution is performed;
- (c) execution breaks due to a data event or from the emulator menu.

1. D0 and D1 flags are updated in advance.
2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
3. Upon returning from the EIT, the DIV0U/DIV0S instruction is executed and the D0 and D1 flags are updated to the same values as those in 1.

■ The following behavior occurs when an ORCCR, STILM, MOV Ri,PS instruction is executed to enable a user interrupt or NMI source while that interrupt is in the active state.

1. The PS register is updated in advance.
2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
3. Upon returning from the EIT, the above instructions are executed and the PS register is updated to the same value as in 1.

6. Notes on Debugger

6.1 Execution of the RETI Command

If single-step execution is used in an environment where an interrupt occurs frequently, the corresponding interrupt handling routine will be executed repeatedly to the exclusion of other processing. This will prevent the main routine and the handlers for low priority level interrupts from being executed (For example, if the time-base timer interrupt is enabled, stepping over the RETI instruction will always break on the first line of the time-base timer interrupt handler).

Disable the corresponding interrupts when the corresponding interrupt handling routine no longer needs debugging.

6.2 Break Function

If the range of addresses that cause a hardware break (including event breaks) is set to the address of the current system stack pointer or to an area that contains the stack pointer, execution will break after each instruction regardless of whether the user program actually contains data access instructions.

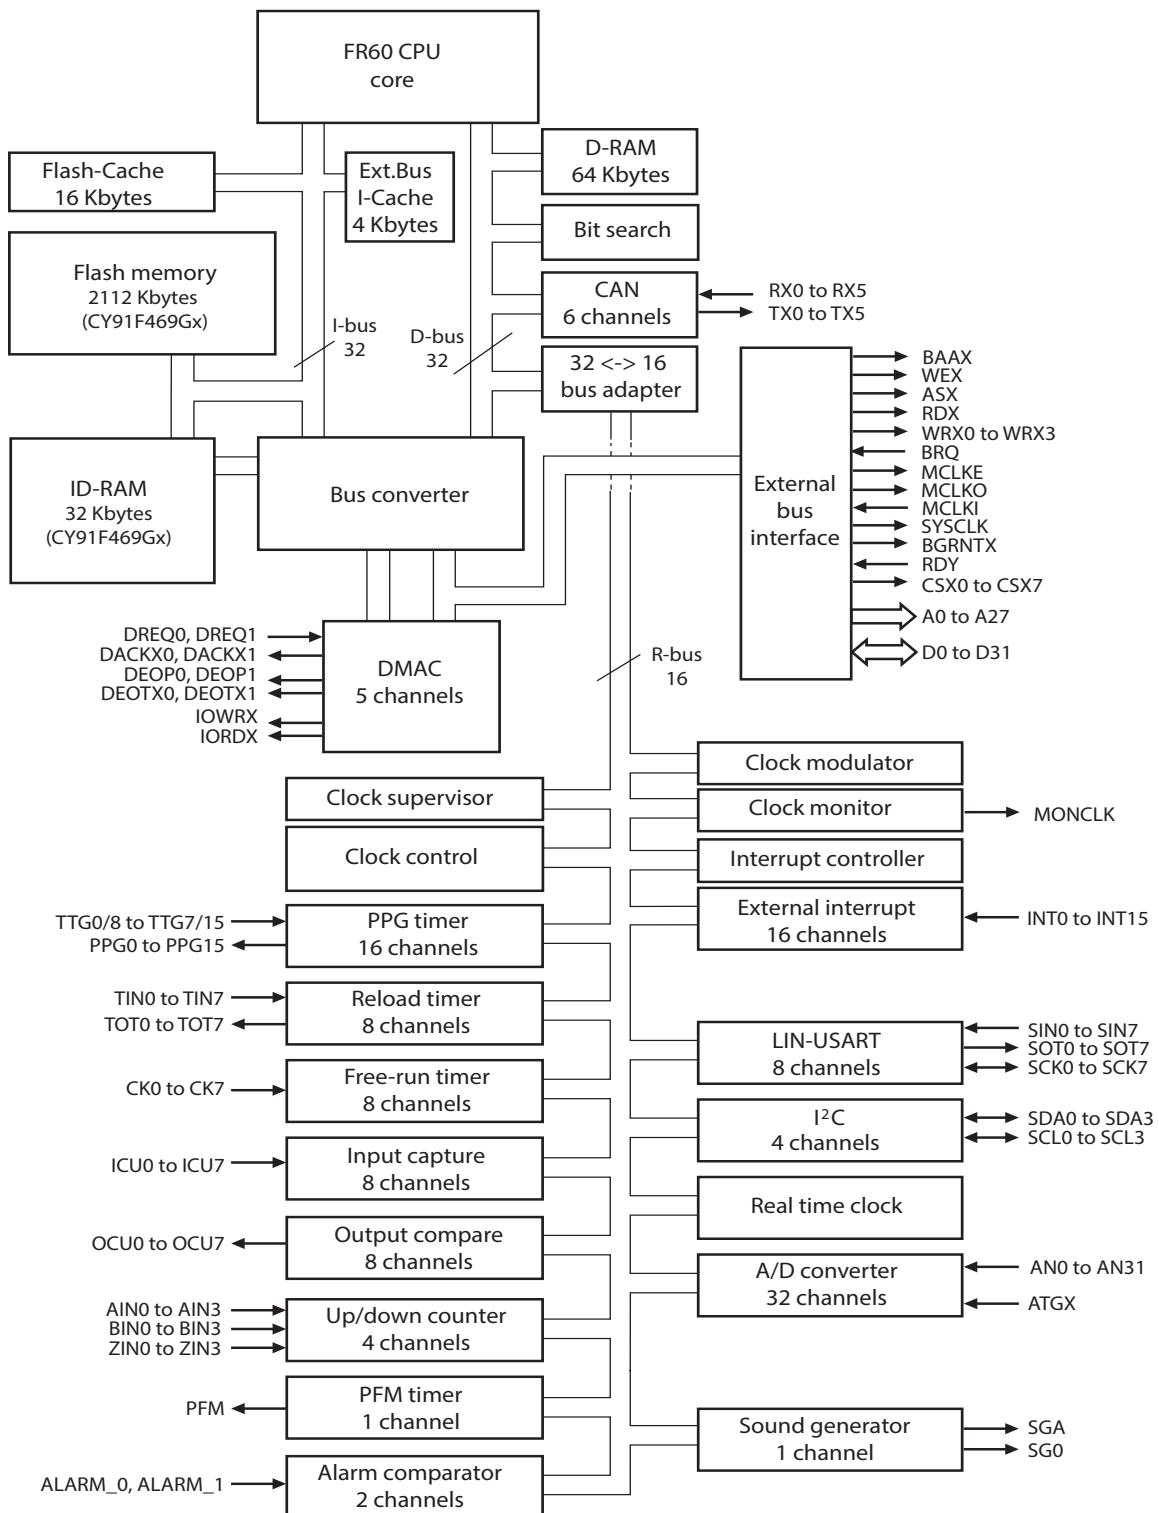

To prevent this, do not set (word) access to the area containing the address of the system stack pointer as the target of the hardware break (including an event breaks).

6.3 Operand Break

It may cause malfunctions if a stack pointer exists in the area which is set as the DSU operand break. Do not set the access to the areas containing the address of system stack pointer as a target of data event break.

8. CPU and Control Unit

The FR family CPU is a high performance core that is designed based on the RISC architecture with advanced instructions for embedded applications.

8.1 Features

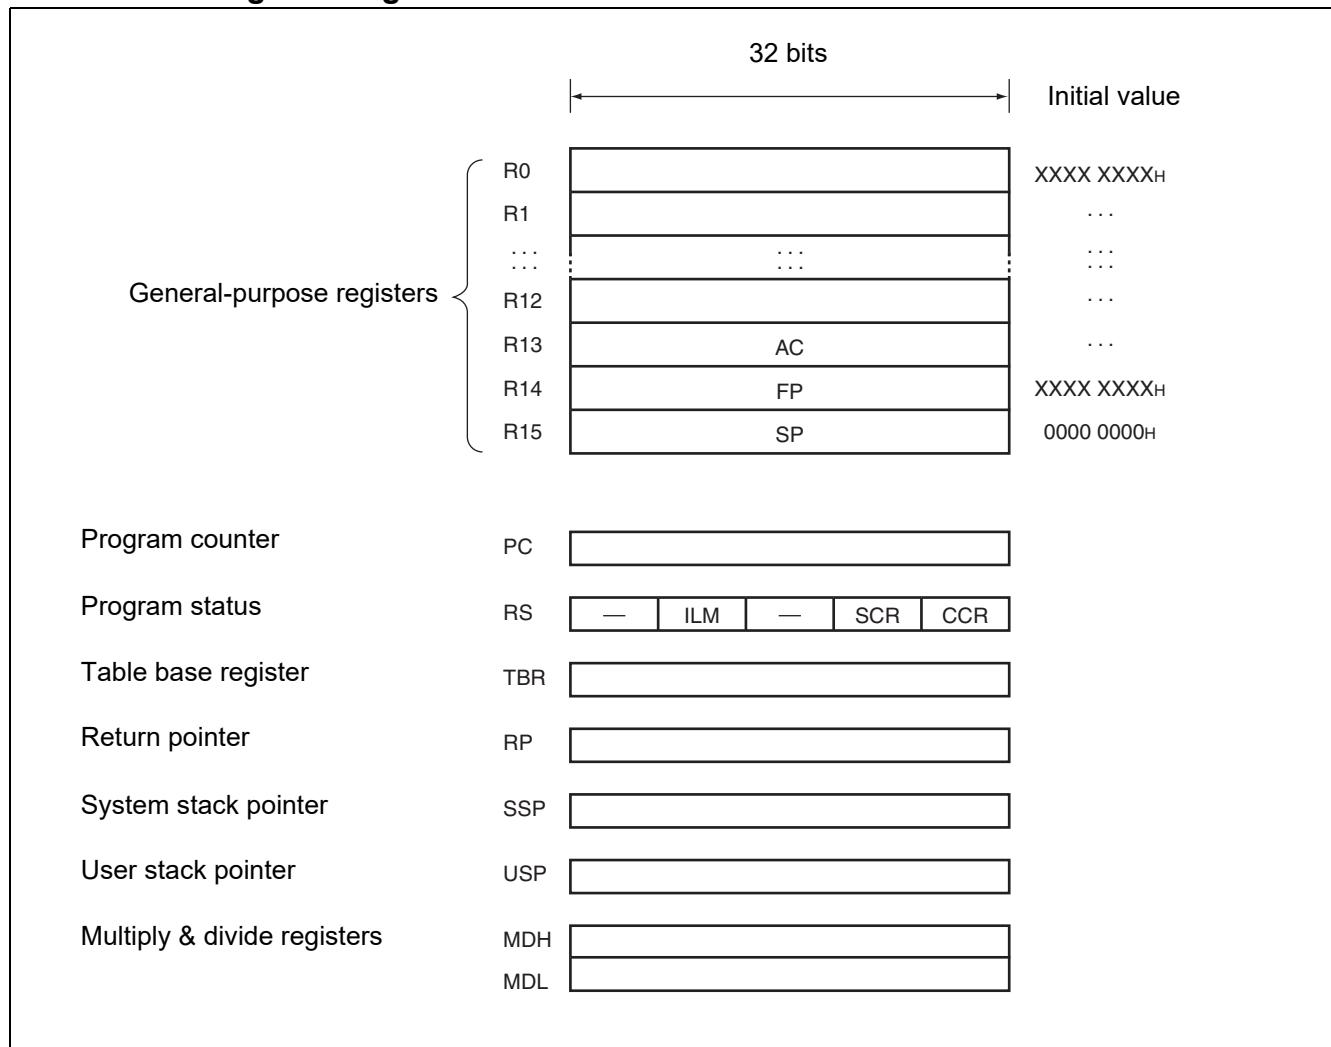

- Adoption of RISC architecture
Basic instruction: 1 instruction per cycle
- General-purpose registers: 32-bit × 16 registers
- 4 Gbytes linear memory space
- Multiplier installed
32-bit × 32-bit multiplication: 5 cycles
16-bit × 16-bit multiplication: 3 cycles
- Enhanced interrupt processing function
Quick response speed (6 cycles)
Multiple-interrupt support
Level mask function (16 levels)
- Enhanced instructions for I/O operation
Memory-to-memory transfer instruction
Bit processing instruction
- Basic instruction word length: 16 bits
- Low-power consumption
Sleep mode/stop mode

8.2 Internal Architecture

- The FR family CPU uses the Harvard architecture in which the instruction bus and data bus are independent of each other.
- A 32-bit ↔ 16-bit buffer is connected to the 32-bit bus (D-bus) to provide an interface between the CPU and peripheral resources.
- A Harvard ↔ Princeton bus converter is connected to both the I-bus and D-bus to provide an interface between the CPU and the bus controller.

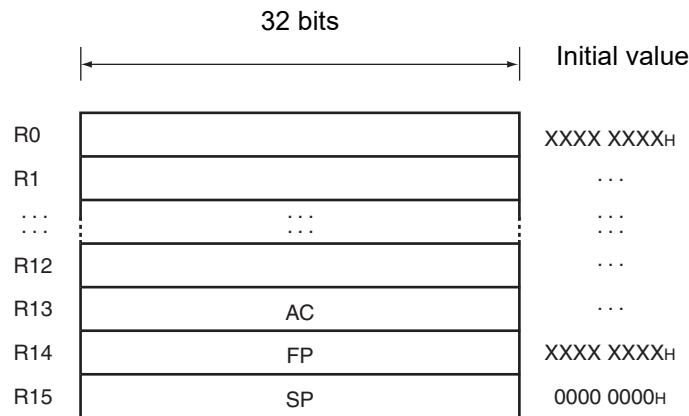

8.3 Programming Model

8.3.1 Basic Programming Model

8.4 Registers

8.4.1 General-Purpose Register

Registers R0 to R15 are general-purpose registers. These registers can be used as accumulators for computation operations and as pointers for memory access.

Of the 16 registers, enhanced commands are provided for the following registers to enable their use for particular applications.

R13: Virtual accumulator

R14: Frame pointer

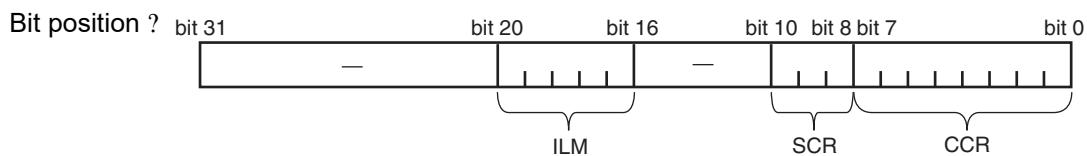

R15: Stack pointer

Initial values at reset are undefined for R0 to R14. The value for R15 is 00000000_H (SSP value).

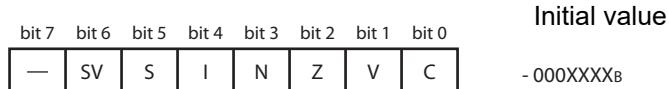

8.4.2 PS (Program Status)

This register holds the program status, and is divided into three parts, ILM, SCR, and CCR.

All undefined bits (-) in the diagram are Reserved bits. The read values are always "0". Write access to these bits is invalid.

8.4.3 CCR (Condition Code Register)

SV: Supervisor flag

S: Stack flag

I: Interrupt enable flag

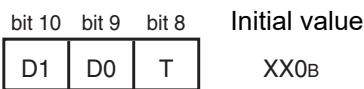

N: Negative enable flag

Z: Zero flag

V: Overflow flag

C: Carry flag

8.4.4 SCR (System Condition Register)

Flag for step division (D1, D0)

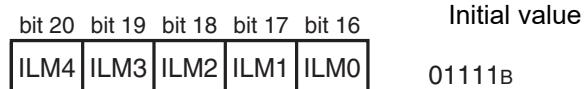

This flag stores interim data during execution of step division.

Step trace trap flag (T)

This flag indicates whether the step trace trap is enabled or disabled.

The step trace trap function is used by emulators. When an emulator is in use, it cannot be used in execution of user programs.

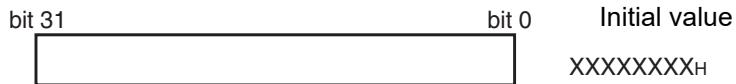

8.4.5 ILM (Interrupt Level Mask register)

This register stores interrupt level mask values, and the values stored in ILM4 to ILM0 are used for level masking.

The register is initialized to value “01111_B” at reset.

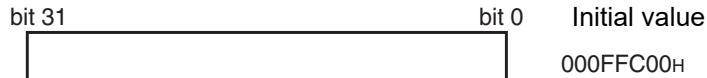

8.4.6 PC (Program Counter)

The program counter indicates the address of the instruction that is being executed.

The initial value at reset is undefined.

8.4.7 TBR (Table Base Register)

The table base register stores the starting address of the vector table used in EIT processing.

The initial value at reset is 000FFC00H.

8.4.8 RP (Return Pointer)

The return pointer stores the address for return from subroutines.

During execution of a CALL instruction, the PC value is transferred to this RP register.

During execution of a RET instruction, the contents of the RP register are transferred to PC.

The initial value at reset is undefined.

8.4.9 USP (User Stack Pointer)

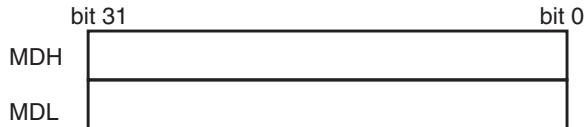

The user stack pointer, when the S flag is "1", this register functions as the R15 register.

■ The USP register can also be explicitly specified.

The initial value at reset is undefined.

■ This register cannot be used with RETI instructions.

8.4.10 Multiply & Divide Registers

These registers are for multiplication and division, and are each 32 bits in length.

The initial value at reset is undefined.

9. Embedded Program/Data Memory (Flash)

9.1 Flash Features

- CY91F469Gx: 2112 Kbytes ($32 \cdot 64$ Kbytes + $8 \cdot 8$ Kbytes = 16.5 Mbits)
- Programmable wait state for read/write access
- Flash and Boot security with security vector at 0x0024:8000 - 0x0024:800F
- Boot security
- Basic specification: Same as MBM29LV400TC (except size and part of sector configuration)

9.2 Operation Modes

9.2.1 64-bit CPU Mode:

- CPU reads and executes programs in word (32-bit) length units.
- Flash writing is not possible.
- Actual Flash Memory access is performed in d-word (64-bit) length units.

9.2.2 32-bit CPU Mode :

- CPU reads and executes programs in word (32-bit) length units.
- Actual Flash Memory access is performed in word (32-bit) length units.

9.2.3 16-bit CPU Mode :

- CPU reads and writes in half-word (16-bit) length units.
- Program execution from the Flash is not possible.
- Actual Flash Memory access is performed in half-word (16-bit) length units.

Note: The operation mode of the flash memory can be selected using a Boot-ROM function. The function start address is 0xBF60. The parameter description is given in the Hardware Manual in chapter 54.6 "Flash Access Mode Switching".

9.4.2 Pin Connections in Parallel Programming Mode

Resetting after setting the MD[2:0] pins to [111] will halt CPU functioning. At this time, the Flash memory's interface circuit enables direct control of the Flash memory unit from external pins by directly linking some of the signals to General Purpose Ports. Please see table below for signal mapping.

In this mode, the Flash memory appears to the external pins as a stand-alone unit. This mode is generally set when writing/erasing using the parallel Flash programmer. In this mode, all operations of the 16.5 Mbits Flash memory's Auto Algorithms are available.

- Minimum wait time after INITX rising: 1.0 ms

9.6 Flash Security

9.6.1 Vector Addresses

Two Flash Security Vectors (FSV1, FSV2) are located parallel to the Boot Security Vectors (BSV1, BSV2) controlling the protection functions of the Flash Security Module:

FSV1: 0x24:8000	BSV1: 0x24:8004
FSV2: 0x24:8008	BSV2: 0x24:800C

9.6.2 Security Vector FSV1

The setting of the Flash Security Vector FSV1 is responsible for the read and write protection modes and the individual write protection of the 8 Kbytes sectors.

9.6.2.1 FSV1 (bit31 to bit16)

The setting of the Flash Security Vector FSV1 bits [31:16] is responsible for the read and write protection modes.

Table 2. Explanation of the Bits in the Flash Security Vector FSV1 [31:16]

FSV1[31:19]	FSV1[18] Write Protection Level	FSV1[17] Write Protection	FSV1[16] Read Protection	Flash Security Mode
set all to "0"	set to "0"	set to "0"	set to "1"	Read Protection (all device modes, except INTVEC mode MD[2:0] = "000")
set all to "0"	set to "0"	set to "1"	set to "0"	Write Protection (all device modes, without exception)
set all to "0"	set to "0"	set to "1"	set to "1"	Read Protection (all device modes, except INTVEC mode MD[2:0] = "000") and Write Protection (all device modes)
set all to "0"	set to "1"	set to "0"	set to "1"	Read Protection (all device modes, except INTVEC mode MD[2:0] = "000")
set all to "0"	set to "1"	set to "1"	set to "0"	Write Protection (all device modes, except INTVEC mode MD[2:0] = "000")
set all to "0"	set to "1"	set to "1"	set to "1"	Read Protection (all device modes, except INTVEC mode MD[2:0] = "000") and Write Protection (all device modes except INTVEC mode MD[2:0] = "000")

9.6.2.2 FSV1 (bit15 to bit0)

The setting of the Flash Security Vector FSV1 bits [15:0] is responsible for the individual write protection of the 8 Kbytes sectors. It is only evaluated if write protection bit FSV1[17] is set.

Table 3. Explanation of the bits in the Flash Security Vector FSV1 [15:0]

FSV1 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
FSV1[0]	SA0	set to "0"	set to "1"	
FSV1[1]	SA1	set to "0"	set to "1"	
FSV1[2]	SA2	set to "0"	set to "1"	
FSV1[3]	SA3	set to "0"	set to "1"	
FSV1[4]	SA4	set to "0"	—	write protection is mandatory!
FSV1[5]	SA5	set to "0"	set to "1"	
FSV1[6]	SA6	set to "0"	set to "1"	
FSV1[7]	SA7	set to "0"	set to "1"	
FSV1[8]	—	set to "0"	set to "1"	not available
FSV1[9]	—	set to "0"	set to "1"	not available
FSV1[10]	—	set to "0"	set to "1"	not available
FSV1[11]	—	set to "0"	set to "1"	not available
FSV1[12]	—	set to "0"	set to "1"	not available
FSV1[13]	—	set to "0"	set to "1"	not available
FSV1[14]	—	set to "0"	set to "1"	not available
FSV1[15]	—	set to "0"	set to "1"	not available

Note: It is mandatory to always set the sector where the Flash Security Vectors FSV1 and FSV2 are located to write protected (here sector SA4). Otherwise it is possible to overwrite the Security Vector to a setting where it is possible to either read out the Flash content or manipulate data by writing. See section “Flash access in CPU mode” for an overview about the sector organization of the Flash Memory.

9.6.3 Security Vector FSV2

The setting of the Flash Security Vector FSV2 bits [31:0] is responsible for the individual write protection of the 64 Kbytes sectors. It is only evaluated if write protection bit FSV1 [17] is set.

Table 4. Explanation of the Bits in the Flash Security Vector FSV2[31:0]

FSV2 bit	Sector	Enable Write Protection	Disable Write Protection	Comment

Note: See section "Flash access in CPU mode" for an overview about the sector organization of the Flash Memory.

10. Memory Space

The FR family has 4 Gbytes of logical address space (2^{32} addresses) available to the CPU by linear access.

- Direct addressing area

The following address space area is used for I/O.

This area is called direct addressing area, and the address of an operand can be specified directly in an instruction.

The size of directly addressable area depends on the length of the data being accessed as shown below.

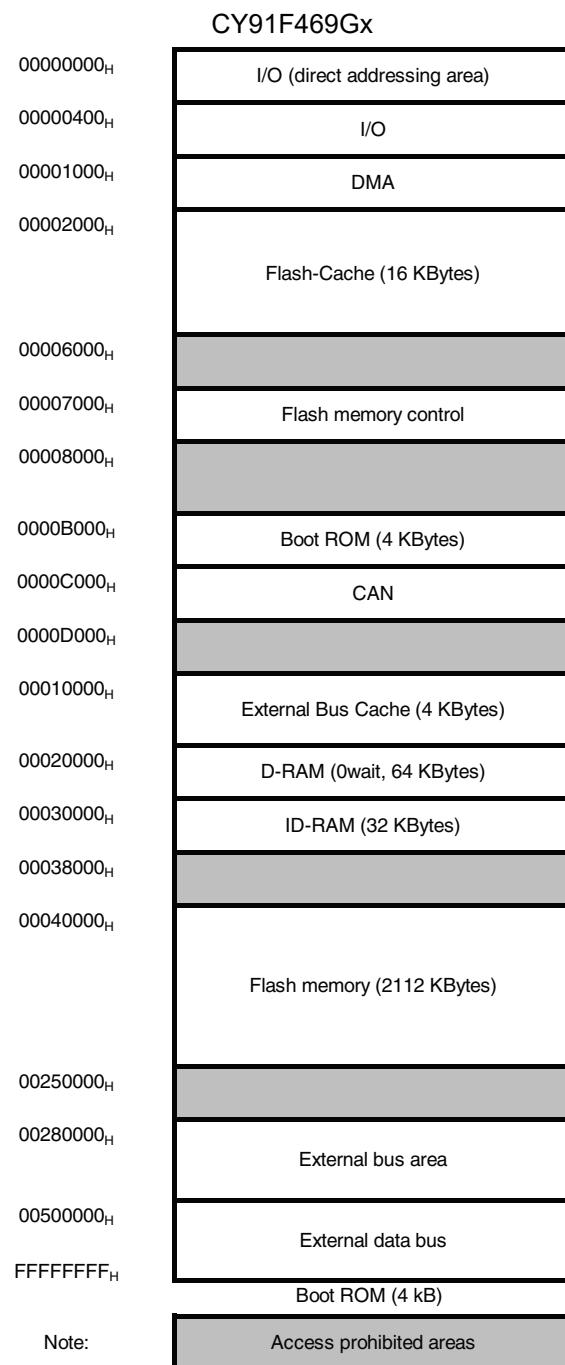

Byte data access : 000_H to $0FF_H$

Half word access : 000_H to $1FF_H$

Word data access : 000_H to $3FF_H$

 Leftmost register address (for word access, the register in column 1 becomes the MSB side of the data.)

Note: Initial values of register bits are represented as follows:

“ 1 ”: Initial value “ 1 ”

“ 0 ”: Initial value “ 0 ”

“ X ”: Initial value “ undefined ”

“ - ”: No physical register at this location

Access is barred with an undefined data access attribute.

1. The Interrupt Control Registers (ICRs) are located in the interrupt controller and set the interrupt level for each interrupt request. An ICR is provided for each interrupt request.

2. The vector address for each EIT (exception, interrupt or trap) is calculated by adding the listed offset to the table base register value (TBR). The TBR specifies the top of the EIT vector table. The addresses listed in the table are for the default TBR value (000FFC00_H). The TBR is initial-

ized to this value by a reset. The TBR is set to 000FFC00_H after the internal boot ROM is executed.

3. ICR23 and ICR47 can be exchanged by setting the REALOS compatibility bit (addr 0C03_H : IOS[0])
4. Used by REALOS
5. Memory Protection Unit (MPU) support

14.1 PLL and Clock Gear Settings

Please note that for CY91F469Gx core base clock frequencies above 88MHz can only be achieved with 1.9V core supply voltage [1].

1. In order to enter this mode please set REGSEL_FLASHSEL=1 and REGSEL_MAINSEL=1 (HWM Chapter 52.3.1)

14.2 Clock Modulator Settings

The following table shows all possible settings for the Clock Modulator in a base clock frequency range from 32MHz up to 88MHz. If Fmax exceeds 88MHz the core supply voltage needs to be set to 1.9V. Please refer to flash access time settings (section 2.3.2.2) to setup the correct voltage according to Fmax in the table below.

The Flash access time settings need to be adjusted according to Fmax while the PLL and clock gear settings should be set according to base clock frequency.

1 The parameter is based on $V_{SS5} = AV_{SS5} = 0.0$ V.

2 AV_{CC5} and $AVRH5$ must not exceed $V_{DD5} + 0.3$ V.

3

- Use within recommended operating conditions.
- Use with DC voltage (current).
- +B signals are input signals that exceed the V_{DD5} voltage. +B signals should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed the rated value at any time, either instantaneously or for an extended period, when the +B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the +B input potential can increase the potential at the power supply pin via a protective diode, possibly affecting other devices.
- Note that if the +B signal is input when the microcontroller is off (not fixed at 0 V), power is supplied through the +B input pin; therefore, the microcontroller may partially operate.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave +B input pins open.

Figure 2. Example of Recommended Circuit :

- 4 Maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.
- 5 Average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 100 ms period.
- 6 Total average output current is defined as the value of the average current flowing through all of the corresponding pins for a 100 ms period.
- 7 The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.

The actual power dissipation depends on the customer application and can be calculated as follows:

$$P_D = P_{IO} + P_{INT}$$

$$P_{IO} = \sum (V_{OL} * I_{OL} + V_{OH} * I_{OH}) \quad (\text{IO load power dissipation, sum is performed on all IO ports})$$

$$P_{INT} = V_{DD5R} * I_{CC} + AV_{CC5} * I_A + AVR_{H5} * I_R \quad (\text{internal power dissipation})$$

8 Worst case value for the BGA package mounted on a 4-layer PCB at specified T_A without air flow.

9 Please contact Cypress for reliability limitations when using under these conditions.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

15.2 Recommended Operating Conditions

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Conversion Time Calculation

$$T_{\text{conv}} = T_{\text{samp}} + T_{\text{comp}}$$

15.4.1 Definition of A/D Converter Terms

■ Resolution

Analog variation that is recognizable by the A/D converter.

■ Nonlinearity error

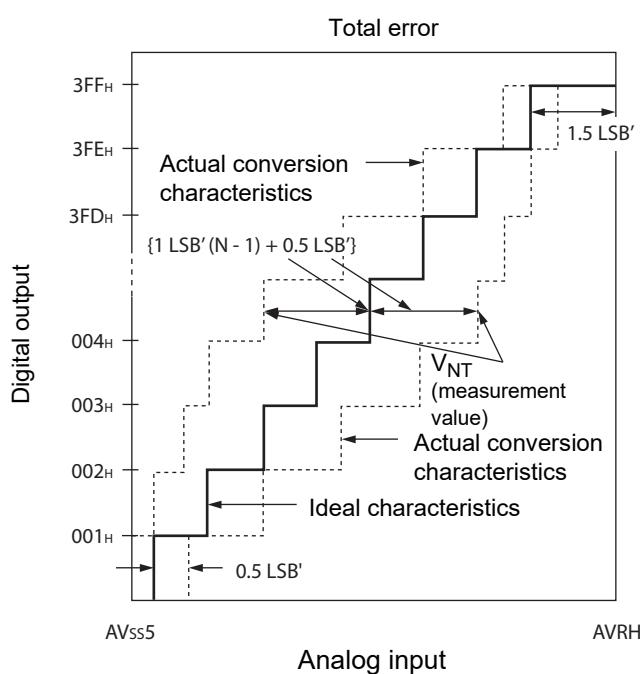

Deviation between actual conversion characteristics and a straight line connecting the zero transition point ($00\ 0000\ 0000_B \leftrightarrow 00\ 0000\ 0001_B$) and the full scale transition point ($11\ 1111\ 1110_B \leftrightarrow 11\ 1111\ 1111_B$).

■ Differential nonlinearity error

Deviation of the input voltage from the ideal value that is required to change the output code by 1 LSB.

■ Total error

This error indicates the difference between actual and theoretical values, including the zero transition error, full scale transition error, and nonlinearity error.

$$1\text{LSB}' (\text{ideal value}) = \frac{\text{AVRH} - \text{AV}_{\text{SS5}}}{1024} [\text{V}]$$

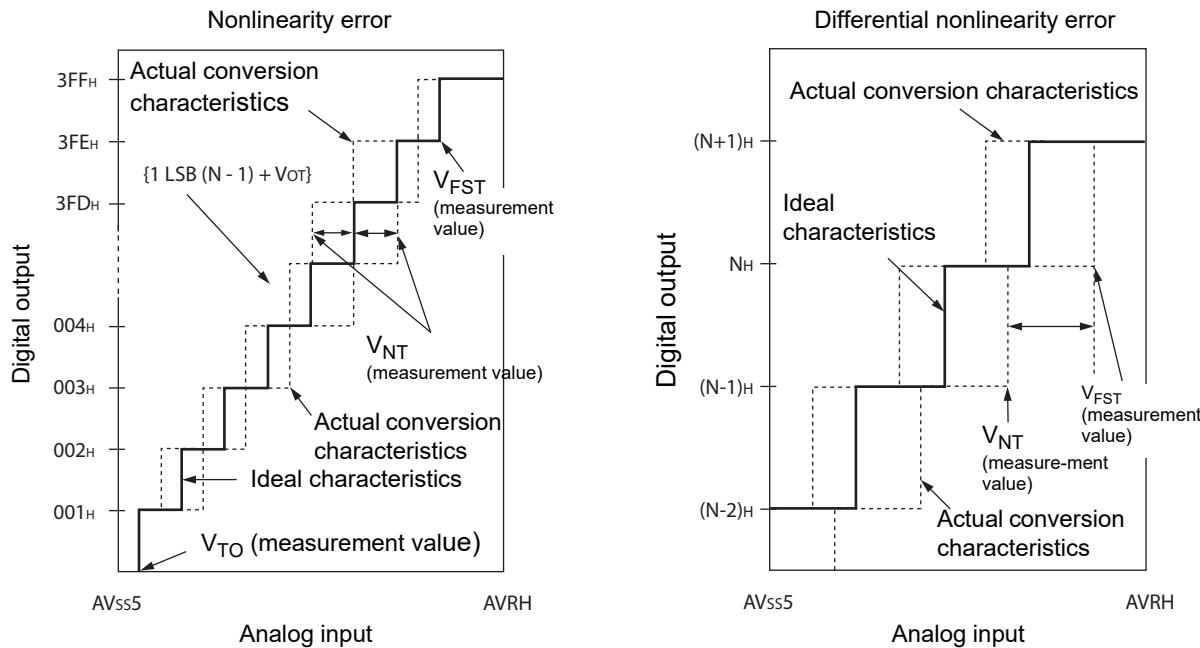

$$\text{Total error of digital output } N = \frac{V_{\text{NT}} - \{1\text{LSB}' \cdot (N - 1) + 0.5\text{ LSB}'\}}{1\text{ LSB}'} [\text{V}]$$

N: A/D converter digital output value

V_{OT}' (ideal value) = AV_{SS5} + 0.5 LSB' [V]

V_{FST}' (ideal value) = AVR_H - 1.5 LSB' [V]

V_{NT}: Voltage at which the digital output changes from (N + 1)_H to N_H

$$\text{Nonlinearity error of digital output } N = \frac{V_{NT} - \{1\text{LSB} \cdot (N - 1) + V_{OT}\}}{1\text{LSB}} \text{ [LSB]}$$

$$\text{Differential nonlinearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1\text{LSB}} - 1 \text{ [LSB]}$$

$$1\text{LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

N: A/D converter digital output value

V_{OT} : Voltage at which the digital output changes from 000_H to 001_H .

V_{FST} : Voltage at which the digital output changes from $3FE_H$ to $3FF_H$.

1. Parameter m depends on t_{SCYCI} and can be calculated as :

- if $t_{SCYCI} = 2*k*t_{CLKP}$, then $m = k$, where k is an integer > 2
- if $t_{SCYCI} = (2*k + 1)*t_{CLKP}$, then $m = k + 1$, where k is an integer > 1

Notes:

- The above values are AC characteristics for CLK synchronous mode.
- t_{CLKP} is the cycle time of the peripheral clock.

15.7.8 External Bus AC Timings at $V_{DD35} = 3.0$ to 4.5 V

■ Conditions during AC measurements

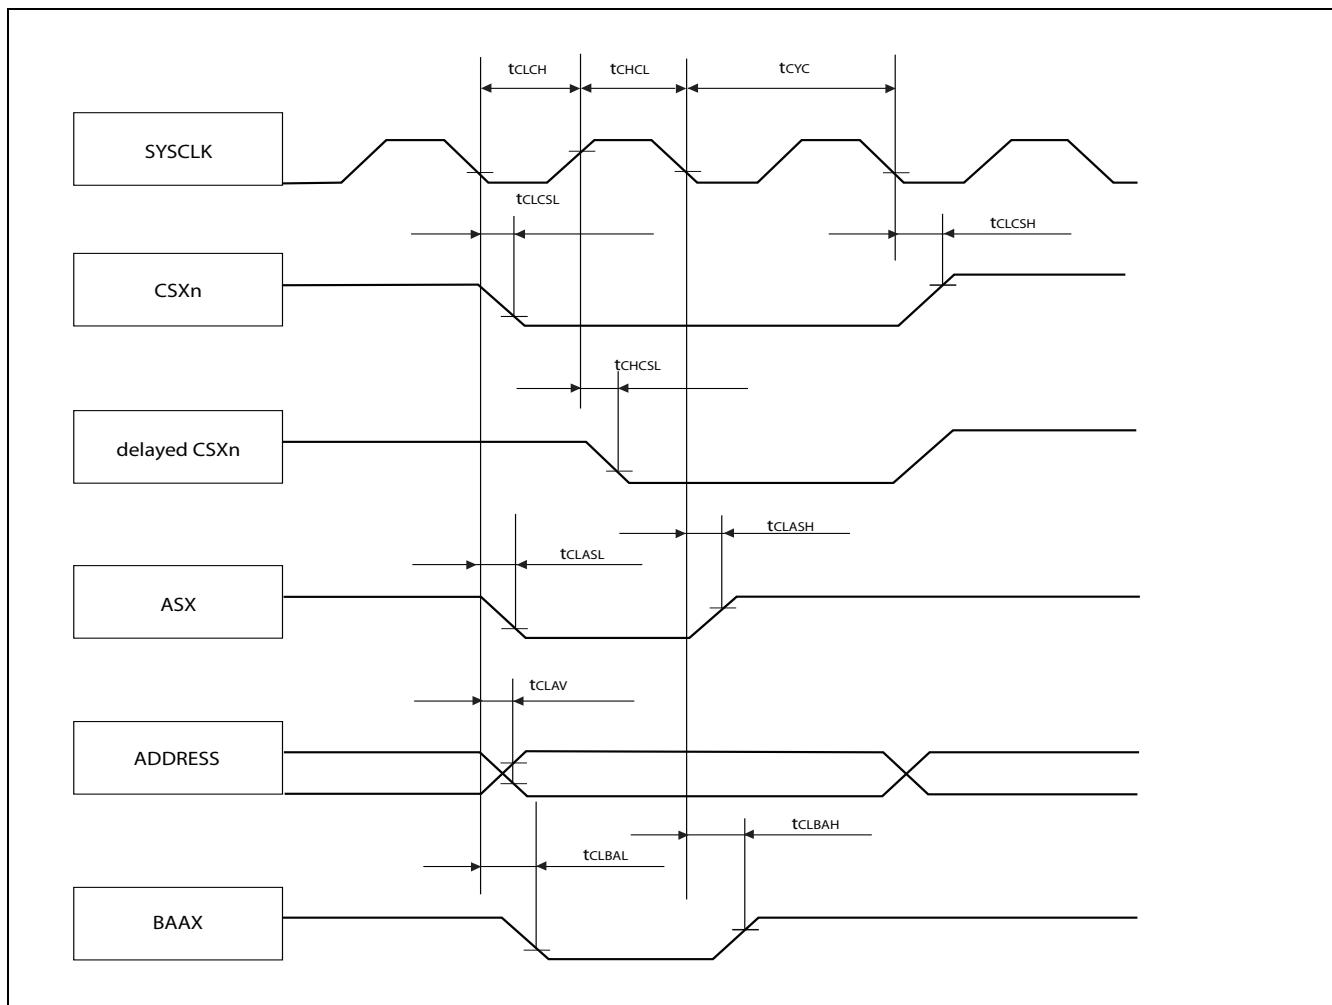

All AC tests were measured under the following conditions:

- $-I_{O_{drive}} = 5$ mA
- $-V_{DD35} = 3.0$ V to 4.5 V, $I_{load} = 3$ mA
- $-V_{SS5} = 0$ V
- $-Ta = -40$ °C to $+125$ °C
- $-C_I = 50$ pF
- $-VOL = 0.2 \cdot V_{DD35}$
- $-VOH = 0.8 \cdot V_{DD35}$
- $-EPILR = 0$, PILR = 1 (Automotive Level = worst case)

NOTES

- ALL DIMENSIONS ARE IN MILLIMETERS.
- DIMENSIONS AND TOLERANCES METHODS PER ASME Y14.5-2009. THIS OUTLINE CONFORMS TO JEP95, SECTION 4.5.
- BALL POSITION DESIGNATION PER JEP95, SECTION 3, SPP-010.
- "e" REPRESENTS THE SOLDER BALL GRID PITCH.
- SYMBOL "MD" IS THE BALL MATRIX SIZE IN THE "D" DIRECTION.
SYMBOL "ME" IS THE BALL MATRIX SIZE IN THE "E" DIRECTION.
n IS THE NUMBER OF POPULATED SOLDER BALL POSITIONS FOR MATRIX SIZE MD X ME.
- DIMENSION "b" IS MEASURED AT THE MAXIMUM BALL DIAMETER IN A PLANE PARALLEL TO DATUM C.
- "SD" AND "SE" ARE MEASURED WITH RESPECT TO DATUMS A AND B AND DEFINE THE POSITION OF THE CENTER SOLDER BALL IN THE OUTER ROW. WHEN THERE IS AN ODD NUMBER OF SOLDER BALLS IN THE OUTER ROW, "SD" OR "SE" = 0. WHEN THERE IS AN EVEN NUMBER OF SOLDER BALLS IN THE OUTER ROW, "SD" = eD/2 AND "SE" = eE/2.
- A1 CORNER TO BE IDENTIFIED BY CHAMFER, LASER OR INK MARK. METALLIZED MARK INDENTATION OR OTHER MEANS.
- "+" INDICATES THE THEORETICAL CENTER OF DEPOPULATED BALLS.
- JEDEC SPECIFICATION NO. REF: N/A.

Version	Date	Remark
2.0	2008-01-08	Initial version
2.1	2008-01-11	I/O circuit type J2: Feedback resistor = approx. $2 * 5 \text{ M}\Omega$.
2.2	2008-02-01	Pins 257 to 320 are GND.
2.3	2008-02-04	Various changes after proofread by FJ
2.4	2008-02-15	Corrected product lineup table: No NMI function, updated disclaimer at the end
2.5	2008-02-22	Corrected naming and size of Flash-cache (F-cache)
2.6	2008-04-29	Flash Operation modes: Added note about the "flash access mode switching" incl. address in Boot ROM Flash parallel programming: wait times added
	2008-08-18	Product Lineup: corrected typos Pin Description: corrected CAN RX (is input only) IO Circuit Type: corrected typos Handling Devices: updated the "Notes on PS register" Interrupt Vector Table: corrected the footnotes Electrical Characteristics: removed the note that analog input/output pins cannot accept +B signal input. DC characteristics: updated PullUp/Down resistance values, corrected the table footnotes, splitted ILV into external and internal LV detection ADC Characteristics: Corrected the items about nonlinearity error FLASH memory parallel programming mode: added section "Poweron Sequence in parallel programming mode" FLASH memory program/erase characteristics: word programming time is for 16- and 32-bit Ordering information: updated the part numbers All pages: Kilobytes are now written with "K"
2.7	2008-08-19	DC characteristics: updated the current consumption values I_{CC} , I_{CCH}
3.0	2009-01-09	DC characteristics: corrected the current consumption values I_{CC} , I_{CCH} Added $T_a=125^\circ\text{C}$ characteristics
