

# 200V Low Charge Injection 8-Channel High Voltage Analog Switch

## Features

- ▶ HVCMOS® technology for high performance
- ▶ Very low quiescent power dissipation (-10µA)
- ▶ Output on-resistance typically 11Ω
- ▶ Low parasitic capacitance
- ▶ DC to 50MHz small signal frequency response
- ▶ -60dB typical off-isolation at 5.0MHz
- ▶ CMOS logic circuitry for low power
- ▶ Excellent noise immunity
- ▶ Serial shift register logic control with latches
- ▶ Flexible operating supply voltages
- ▶ Surface mount packages

## Applications

- ▶ Medical ultrasound imaging
- ▶ Non-destructive evaluation

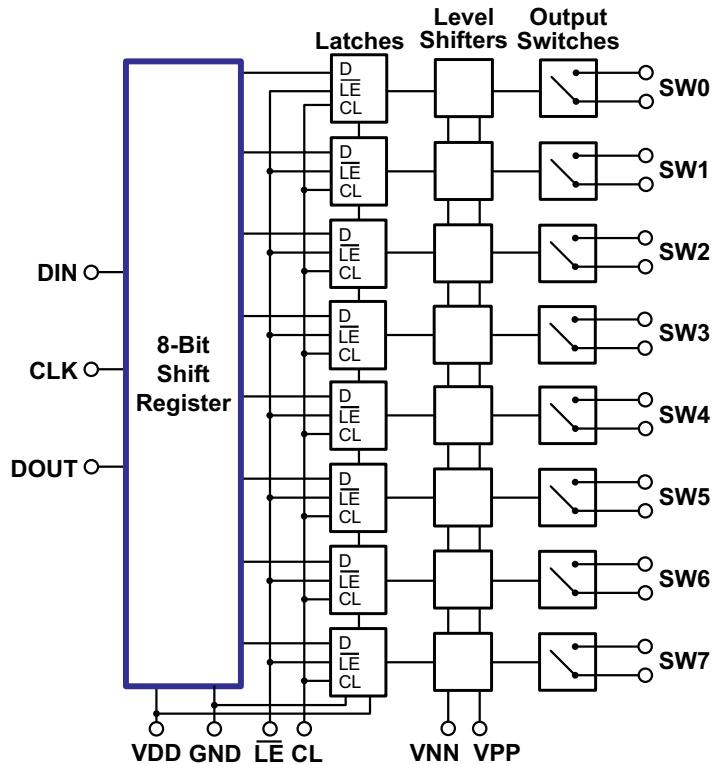

## General Description

The Supertex HV219 is a low switch resistance, low charge injection, 8-channel, 200V, analog switch integrated circuit (IC) intended primarily for medical ultrasound imaging. The device can also be used for NDE (non-destructive evaluation) applications. The HV219 is a lower switch resistance, 11Ω versus 22Ω, version of the Supertex HV20220 device. The lower switch resistance will help reduce insertion loss. It has the same pin configuration as that of the Supertex HV20220PJ and the HV20220FG.

The device is manufactured using Supertex's HVCMOS® (high voltage CMOS) technology with high voltage bilateral DMOS structures for the outputs and low voltage CMOS logic for the input control. The outputs are configured as eight independent single pole single throw 11Ω analog switches. The input logic is an 8-bit serial to parallel shift register followed by an 8-bit parallel latch. The switch states are determined by the data in the latch. Logic high will correspond to a closed switch and logic low as an opened switch.

The HV219 is designed to operate on various combinations of high voltage supplies. For example the  $V_{PP}$  and  $V_{NN}$  supplies can be: +40V/-160V, +100V/-100V, or +160V/-40V. This allows the user to maximize the signal voltage for uni-polar negative, bi-polar, or uni-polar positive.

## Block Diagram

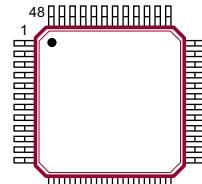

## Ordering Information

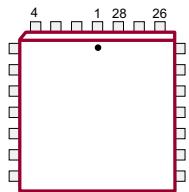

Part Number	Package Option	Packing
HV219FG-G	48-Lead LQFP	250/Tray
HV219FG-G M931		1000/Reel
HV219PJ-G	28-Lead PLCC	38/Tube
HV219PJ-G M904		500/Reel

-G denotes a lead (Pb)-free / RoHS compliant package

## 28-Lead PLCC

## Typical Thermal Resistance

Package	$\theta_{ja}$
48-Lead LQFP	52°C/W
28-Lead PLCC	48°C/W

## Operating Conditions

Sym	Parameter	Value
$V_{DD}$	Logic power supply voltage	4.5V to 13.2V
$V_{PP}$	Positive high voltage supply	40V to $V_{NN} + 200V$
$V_{NN}$	Negative high voltage supply	-40V to -160V
$V_{IH}$	High level input logic voltage	$V_{DD} - 1.5V$ to $V_{DD}$
$V_{IL}$	Low-level input logic voltage	0V to 1.5V
$V_{SIG}$	Analog signal voltage peak-to-peak	$V_{NN} + 10V$ to $V_{PP} - 10V$
$T_A$	Operating free air temperature	0°C to 70°C

## Power Up/Down Sequence

1. Power up/down sequence is arbitrary except GND must be powered up first and powered down last. This applies for applications powering GND of the IC with different voltages.
2.  $V_{SIG}$  must always be at or in between  $V_{PP}$  and  $V_{NN}$  or floating during power up/down transition.
3. Rise and fall times of the power supplies  $V_{DD}$ ,  $V_{PP}$  and  $V_{NN}$  should not be less than 1.0ms.

**DC Electrical Characteristics** (over recommended operating conditions unless otherwise noted)

X	X	X	X	X	X	X	X	H	L	OFF	OFF	OFF	OFF	OFF	OFF	OFF	

**Notes:**

1. The eight switches operate independently.
2. Serial data is clocked in on the L to H transition clock.
3. The switches go to a state retaining their present condition at the rising edge of the  $\overline{LE}$ .
4. When  $\overline{LE}$  is low, the shift register data flows through the latch.
5. Shift register clocking has no effect on the switch states if  $\overline{LE}$  is high.
6. The clear input overrides all other inputs.
