

## 2.5V Wide Range Frequency Clock Driver (45MHz - 233MHz)

### Recommended Application:

- DDR Memory Modules / Zero Delay Board Fan Out
- Provides complete DDR registered DIMM solution with SSTVF16857, SSTVF16859 or SSTV32852

### Product Description/Features:

- Low skew, low jitter PLL clock driver
- 1 to 10 differential clock distribution (SSTL\_2)
- Feedback pins for input to output synchronization
- PD# for power management
- Spread Spectrum-tolerant inputs
- Auto PD when input signal removed

### Specifications:

- Meets PC3200 Class A+ specification for DDR-I 400 support
- Covers all DDRI speed grades

### Switching Characteristics:

- CYCLE - CYCLE jitter: <50ps
- OUTPUT - OUTPUT skew: <40ps
- Period jitter: ±30ps

## Pin Descriptions

PIN NAME	TYPE	DESCRIPTION
VDD	PWR	Power supply, 2.5V
GND	PWR	Ground
AVDD	PWR	Analog power supply, 2.5V
AGND	PWR	Analog ground
CLKT(9:0)	OUT	"True" Clock of differential pair outputs
CLKC(9:0)	OUT	"Complementary" clocks of differential pair outputs
CLK_IN	IN	"Complementary" reference clock input
CLK_INT	IN	"True" reference clock input
FB_OUTC	OUT	"Complementary" Feedback output, dedicated for external feedback. It switches at the same frequency as the CLK. This output must be wired to FB_IN
FB_OUTT	OUT	"True" Feedback output, dedicated for external feedback. It switches at the same frequency as the CLK. This output must be wired to FB_IN
FB_IN	IN	"True" Feedback input, provides feedback signal to the internal PLL for synchronization with CLK_INT to eliminate phase error
FB_IN	IN	"Complementary" Feedback input, provides signal to the internal PLL for synchronization with CLK_IN to eliminate phase error
PD#	IN	Power Down. LVCMOS input

This PLL Clock Buffer is designed for a V<sub>DD</sub> of 2.5V, an AV<sub>DD</sub> of 2.5V and differential data input and output levels.

The **95V857** is a zero delay buffer that distributes a differential clock input pair (CLK\_IN, CLK\_INT) to ten differential pair of clock outputs (CLKT[0:9], CLKC[0:9]) and one differential pair feedback clock output (FB\_OUT, FB\_OUTC). The clock outputs are controlled by the input clocks (CLK\_IN, CLK\_INT), the feedback clocks (FB\_IN, FB\_IN), the 2.5-V LVCMOS input (PD#) and the Analog Power input (AV<sub>DD</sub>). When input (PD#) is low while power is applied, the receivers are disabled, the PLL is turned off and the differential clock outputs are tri-stated. When AV<sub>DD</sub> is grounded, the PLL is turned off and bypassed for test purposes.

When the input frequency is less than the operating frequency of the PLL, approximately 20MHz, the device will enter a low power mode. An input frequency detection circuit on the differential inputs, independent from the input buffers, will detect the low frequency condition and perform the same low power features as when the (PD#) input is low. When the input frequency increases to greater than approximately 20 MHz, the PLL will be turned back on, the inputs and outputs will be enabled and PLL will obtain phase lock between the feedback clock pair (FB\_IN, FB\_IN) and the input clock pair (CLK\_IN, CLK\_INT).

The PLL to the **95V857** clock driver uses the input clocks (CLK\_IN, CLK\_INT) and the feedback clocks (FB\_IN, FB\_IN) provide high-performance, low-skew, low-jitter, output differential clocks (CLKT[0:9], CLKC[0:9]). The **95V857** is also able to track Spread Spectrum Clock (SSC) for reduced EMI.

The **95V857** is characterized for operation from 0°C to 85°C, and will meet JEDEC Standard 82-1 and 82-1A Class A+ for registered DDR clock drivers.

## Absolute Maximum Ratings

Supply Voltage (VDD & AVDD) . . . . .	-0.5V to 4.6V
Logic Inputs . . . . .	GND -0.5 V to V <sub>DD</sub> + 0.5 V
Ambient Operating Temperature . . . . .	0°C to +85°C
Storage Temperature . . . . .	-65°C to +150°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

**Notes:**

1. Unused inputs must be held high or low to prevent them from floating.
2. DC input signal voltage specifies the allowable DC execution of differential input.
3. Differential inputs signal voltages specifies the differential voltage [VTR-VCP] required for switching, where VT is the true input level and VCP is the complementary input level.
4. Differential cross-point voltage is expected to track variations of VDD and is the voltage at which the differential signal must be crossing.

## Timing Requirements

Static Phase Offset	$t_{(\text{static phase offset})}^4$		-50	0	50	ps
Output to Output Skew	$T_{\text{skew}}$				40	ps

### Notes:

1. Refers to transition on noninverting output in PLL bypass mode.
2. While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: duty cycle =  $t_{WH}/t_c$ , where the cycle ( $t_c$ ) decreases as the frequency goes up.
3. Switching characteristics guaranteed for application frequency range.
4. Static phase offset shifted by design.
