## **74HC/HCT652**

### Octal bus transceiver/register; 3-state

Product specification  
File under Integrated Circuits, IC06

September 1993

**Octal bus transceiver/register; 3-state****74HC/HCT652****FEATURES**

- Multiplexed real-time and stored data
- Independent register for A and B buses
- Independent enables for A and B buses
- 3-state
- Output capability: Bus driver
- Low power consumption by CMOS technology
- I<sub>CC</sub> category: MSI.

**APPLICATIONS**

- Bus interfaces.

**DESCRIPTION**

The 74HC/HCT652 are high-speed SI-gate CMOS devices and are pin compatible with Low power Schottky TTL (LSTTL). They are specified in

compliance with Jedec standard no. 7A.

The 74HC/HCT652 consist of 8 non-inverting bus transceiver circuits with 3-state outputs, D-type flip-flops and central circuitry arranged for multiplexed transmission of data directly from the data bus or from the internal storage registers. Data on the "A" or "B" or both buses, will be stored in the internal registers, at the appropriate clock pins ( $CP_{AB}$  or  $CP_{BA}$ ) regardless of the select pins ( $S_{AB}$  and  $S_{BA}$ ) or output enable ( $OE_{AB}$  and  $\overline{OE}_{BA}$ ) control pins. Depending on the select inputs  $S_{AB}$  and  $S_{BA}$  data can directly go from input to output (real time mode) or data can be controlled by the clock (storage mode), this is when the output enable pins this operating mode permits. The output enable pins  $OE_{AB}$  and  $\overline{OE}_{BA}$  determine the operation mode of the transceiver. When  $OE_{AB}$  is LOW, no data transmission from  $A_n$  to  $B_n$  is

possible and when  $\overline{OE}_{BA}$  is HIGH, there is no data transmission from  $B_n$  to  $A_n$  possible. When  $S_{AB}$  and  $S_{BA}$  are in the real time transfer mode, it is also possible to store data without using the internal D-type flip-flops by simultaneously enabling  $OE_{AB}$  and  $\overline{OE}_{BA}$ . In this configuration each output reinforces its input. Thus when all other data sources to the two sets of bus lines are at high-impedance, each set of the bus lines will remain at its last state. This type differs from the HC/HCT646 in one extra bus-management function. This is the possibility to transfer stored "A" data to the "B" bus and transfer stored "B" data to the "A" bus at the same time. The examples at the application information demonstrate all bus management functions.

Schmitt-trigger action in the clock inputs makes the circuit highly tolerant to slower clock rise and fall times.

**QUICK REFERENCE DATA**

GND = 0 V;  $T_{amb} = 25^\circ\text{C}$ ;  $t_r = t_f = 6 \text{ ns}$ ;  $V_{CC} = 4.5 \text{ V}$ ;  $C_L = 50 \text{ pF}$ .

| SYMBOL            | PARAMETER   | CONDITIONS                                  | TYPICAL |     | UNIT |
|-------------------|---|---|---------|-----|------|
|                   |   |   | HC      | HCT |      |
| $t_{PLH}/t_{PZL}$ | propagation delay $A_n/B_n$ to $B_n/A_n$                              | $C_L = 15 \text{ pF}; V_{CC} = 5 \text{ V}$ | 13      | 13  | ns   |
|                   | propagation delay $CP_{AB}/CP_{BA}$ to $B_n/A_n$                      |   | 18      | 20  | ns   |
|                   | propagation delay $S_{AB}/S_{BA}$ to $B_n/A_n$                        |   | 20      | 23  | ns   |
| $t_{PHZ}/t_{PZL}$ | 3-state output enable time $OE_{AB}/\overline{OE}_{BA}$ to $B_n/A_n$  |   | 14      | 15  | ns   |
| $t_{PHZ}/t_{PLZ}$ | 3-state output disable time $OE_{AB}/\overline{OE}_{BA}$ to $B_n/A_n$ |   | 12      | 13  | ns   |
| $f_{max}$         | maximum clock frequency   |   | 92      | 92  | MHz  |
| $C_I$             | input capacitance   |   | 3.5     | 3.5 | pF   |
| $C_{PD}$          | power dissipation capacitance per channel                             | notes 1 and 2                               | 26      | 28  | pF   |

**Notes**

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

$f_i$  = input frequency in MHz;  $C_L$  = output load capacitance in pF;

$f_o$  = output frequency in MHz;  $V_{CC}$  = supply voltage in V;

$\sum (C_L \times V_{CC}^2 \times f_o)$  = sum of the outputs

2. For HC the condition is  $V_I = \text{GND}$  to  $V_{CC}$   
For HCT the condition is  $V_I = \text{GND}$  to  $V_{CC} - 1.5 \text{ V}$

## Notes

1. H = HIGH voltage level  
L = LOW voltage level  
X = don't care  
↑ = LOW-to-HIGH transition
2. The data output functions may be enabled or disabled by various signals at  $OE_{AB}$  and  $\overline{OE}_{BA}$  inputs. Data input functions are always enabled, i.e., data at the bus inputs will be stored on every LOW-to-HIGH transition on the clock inputs.

## Octal bus transceiver/register; 3-state

74HC/HCT652

## DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see "[74HC/HCT/HCU/HCMOS Logic Family Specifications](#)".

Output capability: bus driver

 $I_{CC}$  category: MSI.

## Note to the HCT types

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for unit a load of 1 is given in the family specifications.To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below

| INPUT                             | UNIT LOAD COEFFICIENT |
|-----------------------------------|-----------------------|
| $S_{AB}, S_{BA}$                  | 0.75                  |
| $A_0$ to $A_7$ and $B_0$ to $B_7$ | 0.75                  |
| $CP_{AB}, CP_{BA}$                | 1.50                  |
| $OE_{AB}$                         | 1.50                  |
| $\overline{OE}_{BA}$              | 1.50                  |

## AC CHARACTERISTICS FOR 74HCT

GND = 0 V;  $t_r = t_f = 6$  ns;  $C_L = 50$  pF.

| INPUT             | PARAMETER  | $T_{amb}$ (°C) |      |      |            |      |             | UNIT | TEST CONDITIONS |              |           |
|-------------------|--|----------------|------|------|------------|------|-------------|------|-----------------|--------------|-----------|
