1. INTRODUCTION

The M0116LD Vacuum Fluorescent Display module consists of a 1 row x 16 digit display with one chip controller on board.

2. FEATURES

- 2.1 The MCU can control this module by three control signals, chip select (/SEL), shift clock (SCLK) and serial data (SDATA).
- 2.2 Since a DC/DC convert is used, only +5Vdc power source is required to operate the module.
- 2.3 One chip controller mounted on the module includes the character generator ROM (CG-ROM) of 96 ASCII and 152 European characters.
- 2.4 Eight brightness levels can be selected by dimming function.
- 2.5 High quality blue-green (505nm) vacuum fluorescent display provides an attractive and readable medium. Other colors can be achieved by simple wavelength filters .
- 2.6 Characters are provided with a 5×7 dot matrix.
- 2.7 The module has up to 8 user definable characters. (CG-RAM function)

3. GENERAL DESCRIPTIONS

- 3.1 This specification becomes effective after being approved by the purchaser.
- 3.2 When any conflict is found in the specification, appropriate action shall be taken upon agreement of both parties.
- 3.3 The expected necessary service parts should be arranged by the customer before the completion of production

5.2 Control Command write-in

The control commands should be written-in first after the /CS pin is changed from HIGH to LOW. The control commands are listed up Table 10 and details will be explained.

Table 10

5.2.1 DP (10 Hex~ 1F Hex) : Set Display Position (write-in Address)

This command is used to select a digit to display a character instead of writing the character from the first digit, the write-in starting position can be pointed out by using this command.

Table 11

5.2.2 UDF (20 Hex ~ 27 Hex) : User Definable Font (Save CG-RAM Font Data)

The characters can be designed by using this command. These font data are memorized in the CG-RAM of the module. Any 5×7 dots pattern can be stored in the character code location specified by the b0 ~b2 of 1st byte.

|------------------|-----------------|--------|----------|
| IN TERNATIONAL | M0116LD-161LSA1 | 02 | 11 of 14 |

This command is similar to DP function.

When a user want to display comma and/or decimal point continuously, it isn't needed to re-enter this command. I.e the write-in position is increased automatically after input of 2nd byte. Consequently, if a user doesn't want to display more comma and/or decimal point, the user should make a positive pulse of /CS and write-in DP or another command code.

5.2.4 DIM (50 Hex~ 57 Hex): Dimming

Brightness can be controlled into 8 levels by using this function.

Table 15

| | | | | | | | | 1000_10 |
|----|----|----|----|----|----|----|----|---------------------------|
| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Dimming Level |

| | | | | | 0 | 0 | 1 | 56%(9/16) |
| | | | | | 0 | 1 | 0 | 62%(10/16) |
| 0 | 1 | 0 | 1 | × | 0 | 1 | 1 | 69%(11/16) |
| 0 | 1 | 0 | 1 | ^ | 1 | 0 | 0 | 75%(12/16) |
| | | | | | 1 | 0 | 1 | 81%(13/16) |
| | | | | | 1 | 1 | 0 | 87%(14/16) |
| | | | | | 1 | 1 | 1 | 94%(15/16), Maximum value |

5.2.5 DLNG (60 Hex~ 67 Hex): Set Display Length

This command is used to defined the number of display digit.(9 to 16 Digits)

| | | | | | | | | Table_16 |
|----|----|--|----|------------|----|----|------------|--------------------------|
| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Dimming Level |
| | | | | | 0 | 0 | 0 | 1~16 Digit Default Value |
| | | $ \begin{array}{c ccccccccccccccccccccccccccccccccccc$ | 0 |) × | 0 | 0 | 1 | 1~9 Digit |
| 0 | 1 | | | | 0 | 1 | 0 | 1~10 Digit |
| | | | | | 0 | 1 | 1 | 1~11 Digit |
| | | | | | 1 | 0 | 0 | 1~12 Digit |
| | | | 1 | 1~13 Digit | | | | |
| | | | | 1 | 1 | 0 | 1~14 Digit | |
| | | | | | 1 | 1 | 1 | 1~15 Digit |

5.2.6 ALL (70 Hex ~ 73 Hex) : All Segments ON/OFF

All segments can be display or non-displayed by using this command. This command is useful for testing of VFD module, blinking of display or obviating erroneous display pattern at power on.

Table 17

| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Dimming Level |
|----|----|----|----|----|----|------------------|------------------|--|
| 0 | 1 | 1 | 1 | × | × | 0 0 1 1 | 0 1 0 1 | Maintain current state All Segs are OFF. (Default state) All Segs are ON. All Segs are ON(All ON is higher priority.) |

STANDARD

| 1.0 | MEWHAVEN DISPLAY | DOCUMENT NO. | REV.NO | PAGE |
|-----|------------------|-----------------|--------|----------|
| | INTERNATIONAL | M0116LD-161LSA1 | 02 | 12 of 14 |

5.3 Power On Reset

When the module is turned on, the Micro –Controller on VFD module is initialized automatically. At this time, the displaying statuses are the same as following Table.

Table 18

| Content | After Power On |
|-------------------------|---|
| Display Characters | All Segments (16 digits * 35 dots) are "OFF". |
| Comma and Decimal Point | All commas and Decimal Points are "OFF". |
| Digit Length | Every Digit (1~16 digit) is usable. |
| Dimming Level | Set to 50%(8/16) Dimming. |
| Write-in Position | Write-in position is set to the first (Left End) Digit. |
| CG-RAM Data | Not defined. |

6.OPERATING RECOMMENDATIONS

- 6.1 Avoid applying excessive shock or vibration beyond the specification for the VFD module.
- 6.2 Since VFDs are made of glass material, careful handing is required. I.e. Direct impact with hand material to the glass surface (especially exhaust tip) may crack the glass.
- 6.3 When mounting the VFD module to you system, leave a slight gap between the VFD glass and your front panel. The module should be mounted without stress to avoid flexing of the PCB.
- 6.4 Avoid plugging or unplugging the interface connection with the power on, otherwise it may cause the severe damage to input circuitry.
- 6.5 Slow starting power supply may cause non-operation because one chip micom won't be reset.
- 6.6 Exceeding any of maximum ratings may cause the permanent damage.
- 6.7 Since the VFD modules contain high voltage source, careful handling is required while power is on.
- 6.8 When the power is turned off, the capacitor does not discharge immediately. So the high voltage applied to VFD must not get in contact with ICs. In other words, short-circuit of mounted components on PCB within 30 seconds after power-off may cause damage the module.
- 6.9 The power supply must be capable of providing at least 3 times the rated current, because the surge current may be 3 times the specified current consumption when the power is turned on.
- 6.10 Avoid using the module where excessive noise interference is expected. Noise may affects the interface signal and causes improper operation. And it is important to keep the length of the interface cable less than 50cm.
- 6.11 Since all VFD modules contain C-MOS ICs, anti-static handling procedures are always required.
