

High Voltage $I_o=500mA$ Low Dropout Regulator

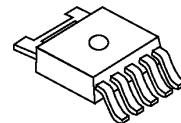

■ GENERAL DESCRIPTION

The NJW4185 is a high voltage and low current consumption low dropout regulator using BCD process.

NJW4185 is mounted to TO-252-5 package and corresponded to Low ESR capacitor (MLCC).

It is suitable for a Car accessory and various applications.

■ PACKAGE OUTLINE

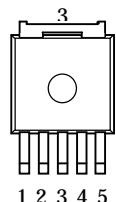

NJW4185DL3

■ FEATURES

● Operating Voltage Range	4.0V ~ 40V(max.)
● Low Current Consumption	55µA(typ.)
● Correspond to Low ESR capacitor (MLCC)	
● Output Current	$I_o(\min.)=500mA$
● Output Voltage Range	2.0V to 15.0V
● High Precision Output	$V_o \pm 1.0\%$
● ON/OFF Function	
● Internal Thermal Overload Protection	
● Internal Over Current Protection	
● Package Outline	TO-252-5

■ PIN CONNECTION

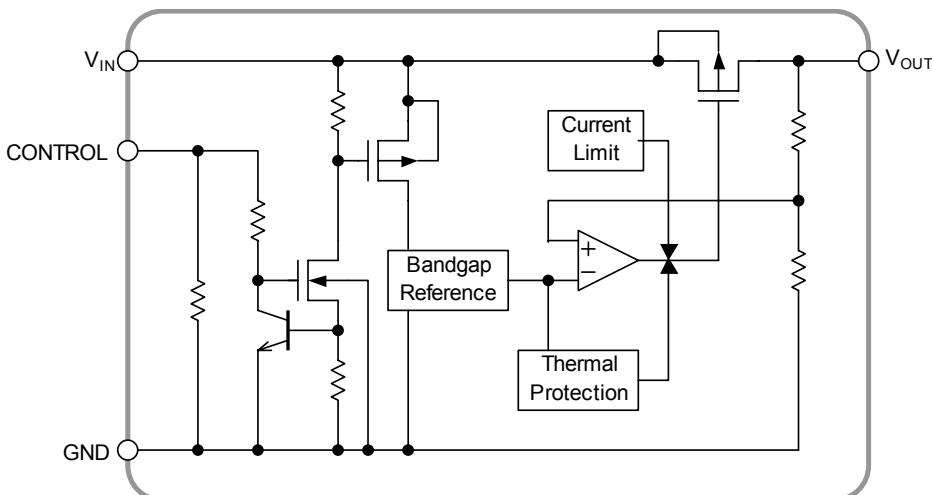

NJW4185DL3

PIN CONFIGURATION

1. V_{IN}
2. CONTROL
3. GND
4. N.C.
5. V_{OUT}

■ BLOCK DIAGRAM

NJW4185

■ OUTPUT VOLTAGE LANK LIST

Device Name	V_{OUT}
NJW4185DL3-02	2.0V
NJW4185DL3-33	3.3V
NJW4185DL3-05	5.0V
NJW4185DL3-08	8.0V
NJW4185DL3-15	15.0V

■ ABABSOLUTE MAXIMUM RATINGS

(Ta=25°C)

PARAMETER	SYMBOL	RATINGS	UNIT
Input Voltage	V_{IN}	-0.3 ~ +45	V
Control Voltage	V_{CONT}	-0.3 ~ +45	V
Output Voltage	V_{OUT}	-0.3 ~ $V_{IN} \leq +17$	V
Power Dissipation	P_D	1190 (*1) 3125 (*2)	mW
Operating Temperature	T_{OPR}	-40 to +85	°C
Storage Temperature	T_{STG}	-50 to +150	°C

(*1): Mounted on glass epoxy board. (76.2×114.3×1.6mm:EIA/JDEC standard size, 2Layers, copper area 100mm²)

(*2): Mounted on glass epoxy board. (76.2×114.3×1.6mm:EIA/JDEC standard size, 4Layers)

(4Layers inner foil: 74.2 x 74.2mm applying a thermal via hall to a board based on JEDEC standard JESD51-5)

■ INPUT VOLTAGE RANGE

V_{IN} =4.0V ~ 40V

■ ELECTRICAL CHARACTERISTICS

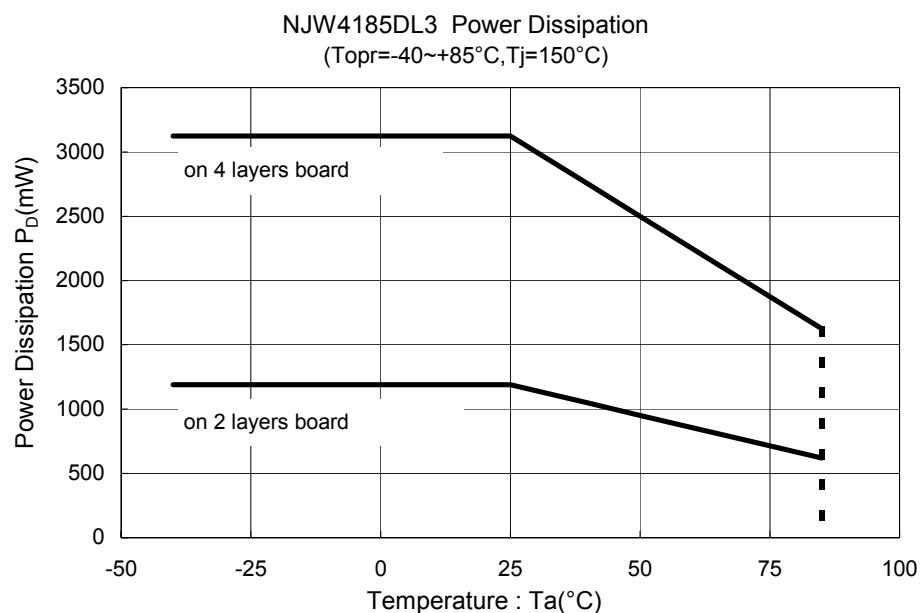

Unless otherwise noted, $V_{IN}=V_O+1V(V_O \geq 3V)$, $C_{IN}=1\mu F$, $C_O=2.2\mu F$, Ta=25°C
 $V_{IN}=4V(V_O < 3V)$, $C_{IN}=1\mu F$, $C_O=4.7\mu F$, Ta=25°C

PARAMETER	SYMBOL	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Output Voltage	V_O	$I_O = 30mA$	-1.0%	-	+1.0%	V
Quiescent Current	I_Q	$I_O = 0mA$, except I_{CONT}	-	55	90	μA
Quiescent Current at Control OFF	$I_{Q(OFF)}$	$V_{CONT}=0V$	-	-	1	μA
Output Current	I_O	$V_O \times 0.9$	500	-	-	mA
Line Regulation	$\Delta V_O / \Delta V_I$	$V_{IN} = V_O + 1V \sim 40V, I_O = 30mA (V_O \geq 3V)$ $V_{IN} = 4V \sim 40V, I_O = 30mA (V_O < 3V)$	-	-	0.03	%/V
Load Regulation	$\Delta V_O / \Delta I_O$	$I_O = 0mA$ to 500mA	-	-	0.006	%/mA
Ripple Rejection	RR	$V_{IN} = 4V, e_{in} = 200mVrms, f = 1kHz, I_O = 10mA$	$V_O = 2.0V$	-	67	-
		$V_{IN} = V_O + 1V, e_{in} = 200mVrms, f = 1kHz, I_O = 10mA$	$V_O = 3.3V$	-	62	-
			$V_O = 5.0V$	-	60	-
			$V_O = 8.0V$	-	55	-
			$V_O = 15V$	-	50	-
Dropout Voltage	ΔV_{IO}	$I_O = 300mA$	-	0.27	0.42	V
Average Temperature Coefficient of Output Voltage	$\Delta V_O / \Delta T_a$	$T_a = 0$ to 85°C, $I_O = 30mA$	-	±50	-	ppm/°C
Control Current	I_{CONT}	$V_{CONT} = 1.6V$	-	1	3	μA
Control Voltage for ON-state	$V_{CONT(ON)}$		1.6	-	-	V
Control Voltage for OFF-state	$V_{CONT(OFF)}$		-	-	0.6	V

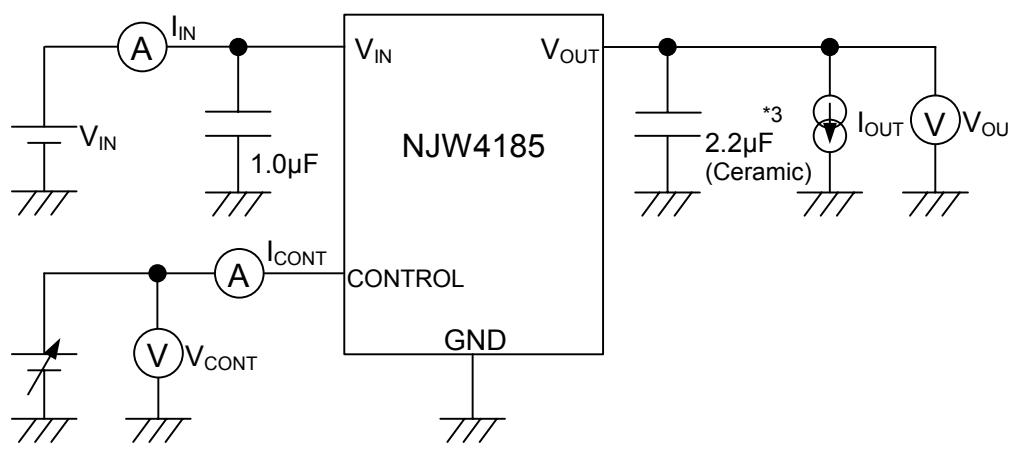

The above specification is a common specification for all output voltages.

Therefore, it may be different from the individual specification for a specific output voltage.

■ POWER DISSIPATION vs. AMBIENT TEMPERATURE

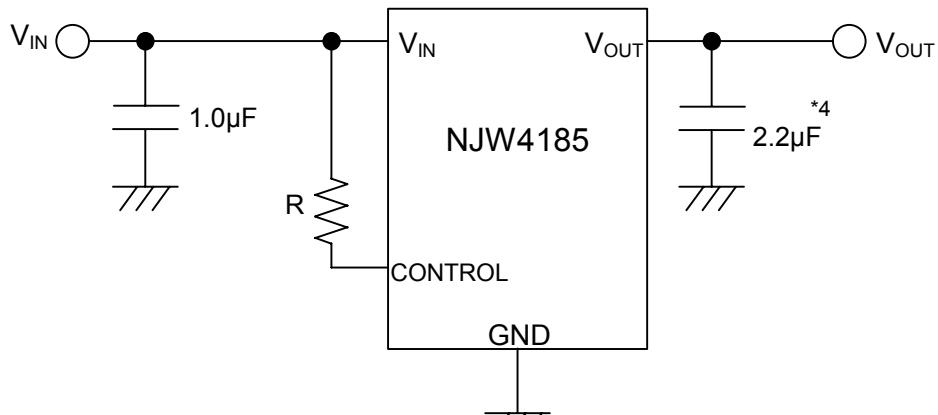

■ TEST CIRCUIT

NJW4185

■ TYPICAL APPLICATION

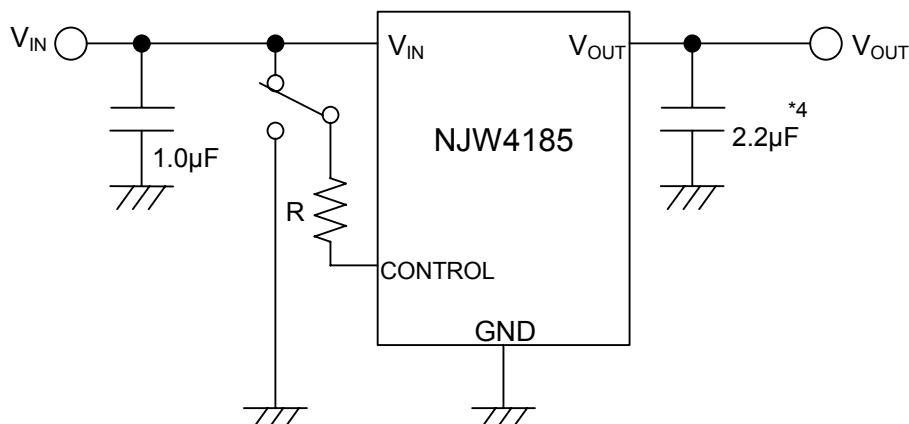

- ① In the case where ON/OFF Control is not required

*4 : $V_o < 3.0V$ version : $C_o = 4.7\mu F$

Connect control terminal to V_{IN} terminal

- ② In use of ON/OFF CONTROL

*4 : $V_o < 3.0V$ version : $C_o = 4.7\mu F$

State of control terminal:

- "H" → output is enabled.
- "L" or "open" → output is disabled.

*In the case of using a resistance "R" between V_{IN} and control.

If this resistor is inserted, it can reduce the control current when the control voltage is high.

The applied voltage to control terminal should set to consider voltage drop through the resistor "R" and the minimum control voltage for ON-state.

The $V_{CONT(ON)}$ and I_{CONT} have temperature dependence as shown in the "Control Current vs. Temperature" and "Control Voltage vs. Temperature" characteristics. Therefore, the resistance "R" should be selected to consider the temperature characteristics.

*Input Capacitor C_{IN}

Input Capacitor C_{IN} is required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use the recommended C_{IN} value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{IN} as shortest path as possible to avoid the problem.

*Output Capacitor C_O

Output capacitor (C_O) will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

Use of a smaller C_O may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

On the other hand, Use of a larger C_O reduces output noise and ripple output, and also improves output transient response when rapid load change.

Therefore, use the recommended C_O value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{OUT} as shortest path as possible for stable operation

The recommended capacitance depends on the output voltage rank. Especially, low voltage regulator requires larger C_O value.

In addition, you should consider varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, a DC bias characteristic and so on) and unevenness peculiar to a capacitor supplier enough.

When selecting C_O , recommend that have withstand voltage margin against output voltage and superior temperature characteristic.

NJW4185

*The notes of the evaluation when output terminal is shorted to GND

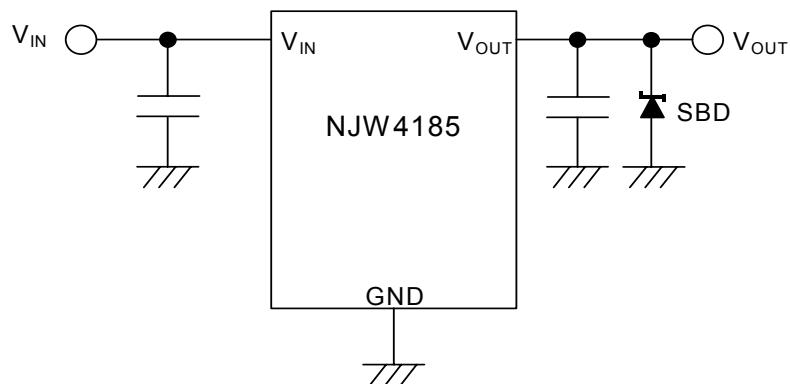

When evaluated short circuit test, the IC may break down because of regenerated energy by the parasitic inductance included in wiring pattern.

It phenomenon appears conspicuously when output voltage is high($V_o=8.0V$ or more)or connected to inductive load.

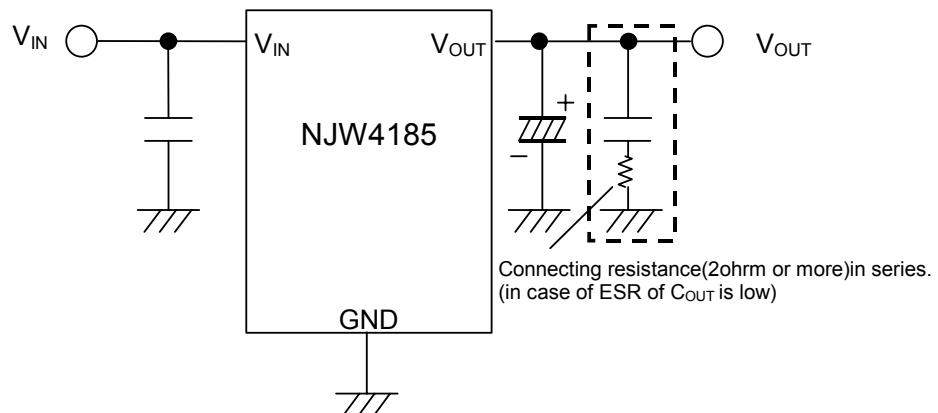

In case of short circuit in actual application, not likely to destruction of IC because of some of Resistance exist between load.

If happened above phenomenon by the short circuit test with the actual application, recommend connecting schottky barrier diode(SBD) between V_o terminal and the GND or using output condensers that have ESR more than 2ohrm like a tantalum or aluminum electrolytic capacitor.(see below figure)

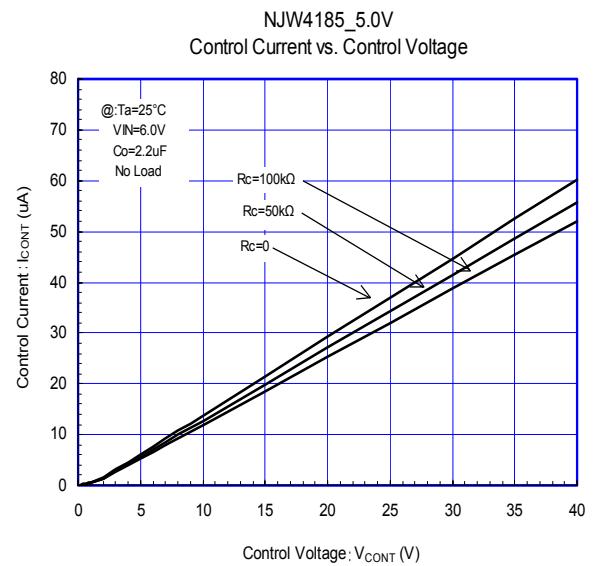

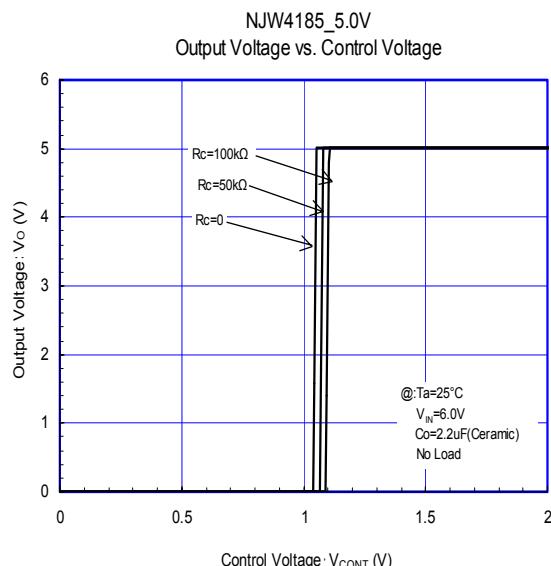

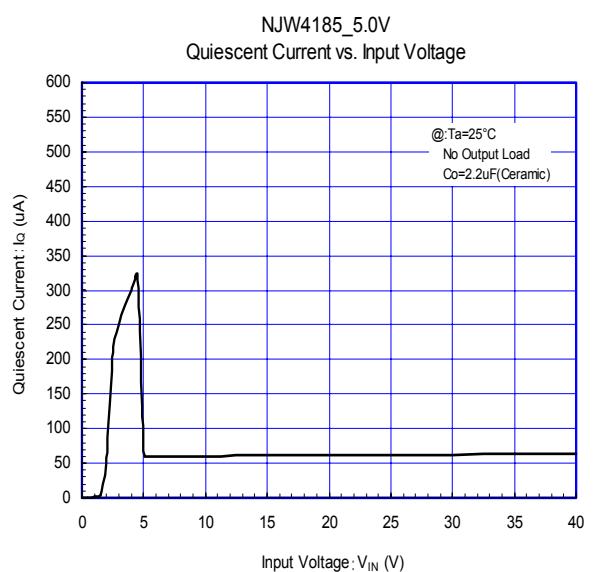

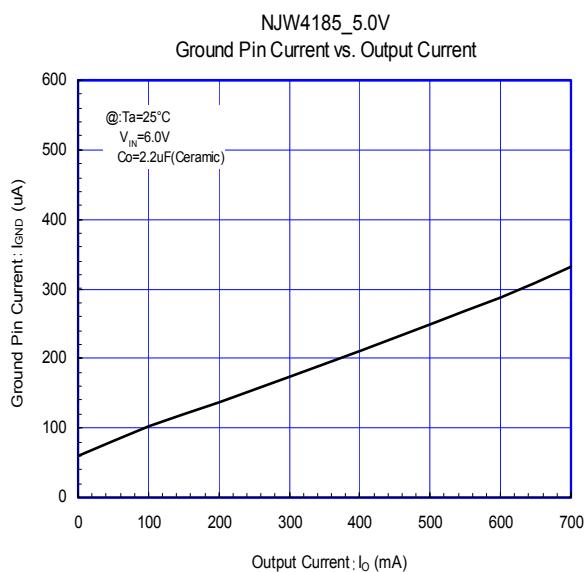

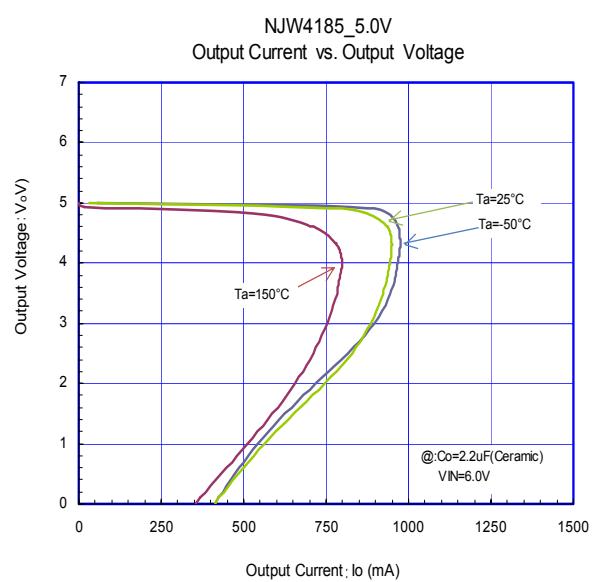

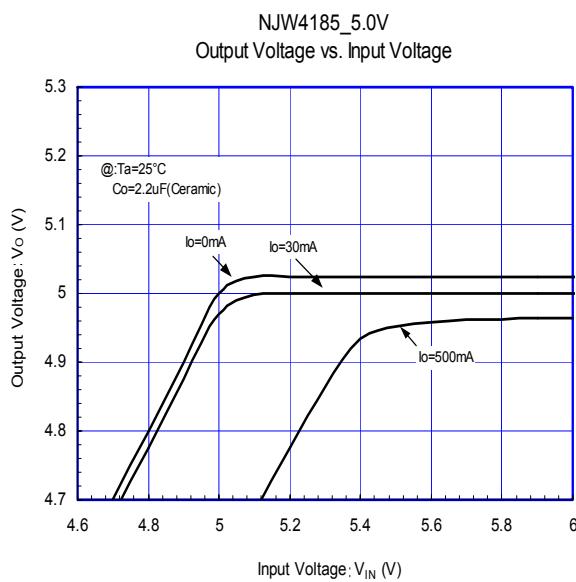

(a) In case of insert Schottky barrier diode between output terminal - GND

(b) In case of using the electrolysis condenser or insert series resistance
