NTE4528B & NTE4528BT Integrated Circuit CMOS, Dual Retriggerable/Resettable Monostable Multivibrator

Description:

The NTE4528B (16-Lead DIP) and NTE4528BT (SOIC-16) are dual, retriggerable, resettable monostable multivibrators that may be triggered from either edge of an input pulse, and produces an output pulse over a wide range of widths, the duration of which is determined by the external timing components, C_X and R_X .

Features:

- Diode Protection on All Inputs
- Triggerable from Leading or Trailing Edge Pulse
- Supply Voltage Range = 3Vcd to 18Vdc
- Capable of Driving Two Low-Power TTL Loads or One Low-Power Schottky TTL Load Over the Rated Temperature Range
- These devices should only be used in circuits where the pulse width is $< 10\mu s$. For circuits requiring a pulse width $> 10\mu s$, please see NTE4538B, which is pin-for-pin compatible.

Absolute Maximum Ratings: (Voltages Referenced to V_{SS} , Note 1)

DC Supply Voltage, V_{DD}	-0.5 to +18.0V
Input Voltage (DC or Transient), V_{in}	-0.5 to V_{DD} to +0.5V
Output Voltage (DC or Transient), V_{out}	-0.5 to V_{DD} to +0.5V
Input Current (DC or Transient, Per Pin), I_{in}	$\pm 10\text{mA}$
Output Current (DC or Transient, Per Pin), I_{out}	$\pm 10\text{mA}$
Power Dissipation (Per Package), P_D	500mW
Temperature Derating (from $+65^\circ$ to $+125^\circ\text{C}$)	-7.0mW/ $^\circ\text{C}$
Ambient Temperature Range, T_A	-55° to +125°C
Storage Temperature Range, T_{stg}	-65° to +150°C
Lead Temperature (During Soldering, 8sec max), T_L	+260°C

Note 1. Stresses exceeding Absolute Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

These devices contain protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range $V_{SS} \leq (V_{in} \text{ or } V_{out}) \leq V_{DD}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}).

Electrical Characteristics: (Voltages referenced to V_{SS}, Note 2)

Parameter	Symbol	V _{DD} Vdc	-55°C		+25°C			+125°C		Unit
